Raising the cathode voltage moves the tube rapidly towards class C operation, increasing efficiency and decreasing linearity. This effect is indicated by Svetlana's specifications for the 4CX1600, which shows efficiency rising from 61 to 72 %, and IMD increasing from -36 dB (below a single tone of a two tone test) to -30 dB when a catode resistor is added to a 4CX1600!

Gary's text called my attention to yet another very good reason why the correct grid resistor should have been selected in these articles, rather than the addition of a simple cathode resistance to correct a grid loading

error.

Adding the cathode resistance, without careful consideration of the modification of the conduction angle, will almost certainly increase IMD. This is true even though the user becomes more comfortable with the parameters under steady state conditions.

The more technical information I hear about the two articles Gary mentioned, the more questions I have about the effort actually made to design a clean HF amplifier. Tetrode design is complex and must be carefully done to avoid unwanted distortion.

It's no wonder grounded grid amplifiers took over the amateur market. Tetrodes are more difficult to design, tune, operate, and analyze than grounded grid triodes. They even confuse experts at times.

1818. Re: QST conflict of interest Again!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-03 00:00:00 UTC
From: w8jitom@aol.com
Message-ID: <4mcscq$59a@newsbf02.news.aol.com>
Source record: 201805

I'm not sure if my other responses made it in to the system or not, there have been some problems. But let's ignore all the unrelated and unsubstantiated dribble and set the record straight on tetrodes, grid loading, IMD, and feedback.

In article <1996Apr30.154003.3618@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us (Gary Coffman) writes:

>Perhaps better still is to have a PA with sufficient headroom and
>negative feedback that it can deal with a range of drive powers
>without resorting to ALC. This is where the common cathode tetrode
>amp can shine. If you want to do compression, let a dedicated
>speech processor in the exciter do that.

And this is the heart of my technical objections.

Adding a cathode resistor does not guarantee correct negative feedback. Adding cathode resistance usually **increases** IMD in grid driven tetrode PA's unless the designer and operator are very careful.

For an example of incomplete design analysis, Gary earlier casually subtracted the cathode's positive voltage excursion from the drive voltage, but the cathodes positive excursion also subtracts from the screen voltage. This has the undesired effect of reducing the screen voltage just when it is needed the most, under maximum drive and peak signal conditions.

The phase delays in charging and discharging any cathode to ground capacitances were also ignored, as were correct voltage analysis of the system. It just isn't as simple as made out to be by the casual designer. If extreme care isn't taken in both design and tuning, linearity and IMD will be greatly **reduced** by the addition of cathode resistance. The conduction angle is reduced, efficiency increased, and IMD products are made stronger by the incorrect application of cathode resistance.

Svetlana shows this PLAINLY in it's own data, with 5th order IMD products increasing over ***400 times*** in level by the addition of cathode resistance. Fifth order products increase from a claimed value of -58 dB to a very poor -34 dB (below a single tone of a two tone test) when a resistance is added to the cathode.

A garden variety triode like the 8877 typically produces 5th order IMD products in the -45 to -50 dB (below single tone of tt test) without fancy feedback circuitry and does so with relatively non-critical tuning, and handily beats the 4CX1600 tetrode by several dB in lower order products under all conditions. Even when severly mistuned the 8877 still exceeds the 4CX1600's specs with the cathode resistance included.

Why then did someone suggest this very circuit, a circuit Svetlana shows as increasing IMD by a factor of over 400 times in level, as an "upgrade"? Why not do it right? Is it because the designer didn't know, or because marketing demands require making the circuit simple even if a bit more dirty?

Well designed tetrode amplifiers are certainly no cleaner than triodes, as a general rule, in amateur type service. More importantly... if the design, operation, tuning, or construction is anything less than perfect tetrodes deteriorate much more rapidly than GG triodes in performance. At best the user starts out with something that may be better or worse, and runs more risk of performance going down hill rapidly.

It takes great effort to design a tetrode PA correctly. Collins did do a super design in the 30L1, using a 4CX1000 in cathode driven AB1 with an innovative circuit that reduces the chance of driving the grid into current. Putting a resistor in the cathode certainly doesn't produce a "30L1 caliber design".

Add to this the drive incompatability present in the recent designs, and all the ingredients for very rough splattering signals are present. Even W6FR's article about the 4CX1600 points out that "it is very difficult, if not impossible, to detect grid current under voice conditions. This current, if present, will seriously and almost exponentially degrade the linearity of the amplifier." He goes on to almost insist a scope be used in a special test to properly load the tetrode PA.

W6FR took almost an entire page warning the user of the frailties and difficulty of operation of a tetrode amplifier, yet some nexperienced even with the terms used to describe amplifier characteristics would have us believe the same tubes an experienced designer like W6FR warns us about provide guaranteed performance improvements.

I really can't control other's personal opinions, or answer every silly statement based on "Heaven knows what" theory or science. But I, for one, don't look forward to an abundence of "ratty tetrodes" (partially from poor design and partially from the great difficulty of proper tuning) being used on HF bands.

I have no problem supporting any article that tells the truth. And the truth is tetrodes are out of place in most amplifiers used by amateurs. This is especially true when a few components could be changed to make the design less troublesome.

Adding cathode resistance (instead of correcting the grid resistance miscalculation), using a grid resistance chosen for SWR and component count (over correct values), and failure to warn of other potential problems (to paint the tube as a "superior product") is simply inexcusable. Especially when the article is openly and incorrectly critical of superior products that do the job much better in the same application.

The technical facts are very clear in this matter.

The IC-706 manual contains the entire command set for CI-V. No ICOM has undocumented CI-V commands lurking. Never seen an ICOM that would allow setting of CTCSS tones, alpha numerics in memories etc. Some ICOMs have more commands available. You could purchase the CI-V reference manual direct from ICOM and simply try every command listed for all radios.

The CI-V reference manual cost $ 15.00 from ICOM plus the usual shipping and handling fees.

1821. KaWin 6.38 released on the web

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-03 00:00:00 UTC
From: stan@mutadv.com
Message-ID: <4md4ko$c1o@news-2.csn.net>
Source record: 201808
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.amateur.equipment

KAWIN NEWS

KaWin 6.38 is ready for download from the KaWin Home Page!

New files are:
KAWIN638.EXE the full KaWin system for new users,
KAWUP638.EXE just the updated KAWIN.EXE and squawk file,
KAWINHLP.EXE the latest KAWIN.HLP, help file.

The new features in version 6.38 are logging and Yapp!

The new logging feature is a modest start at a very big subject. A simple text file, in comma-delimited format for easy import into other programs, stores a wealth of info on your QSOs. See the new help file for details.

With the addition of a very full implementation of the Yapp file transfer protocol and a significant enhancement of the existing KaWin HF protocol, KaWin becomes the undisputed leader in file transfer technology for RF datacomm. The following table summarizes the features of the three protocols that KaWin now supports:

Feature	KaWin/HF	Yapp	Gold
Applicable modes	G-tor/Pactor	Packet	Packet
Full binary transparency	yes	yes	yes
Robust error detection	yes	yes	yes
Auto-start remote upload/download	yes	yes	yes
Auto-start remote directory request	yes	no	yes
Multiple file selection on Send File	yes	yes	no
Wildcards on Get File	yes	yes	no
Restartable after a broken transfer	yes	yes	yes
Verifies original file on restarts	yes	yes	no
Keyboard chat during transfer	no	no	yes

All currently reported bugs are fixed in 6.38.

To add to the KaWin News mailing list, send email to stan@mutadv.com with the word SUBSCRIBE in the subject line, or use the handy subscription link on the KaWin Home Page. To be removed from the list, send email to stan@mutadv.com with the word UNSUBSCRIBE in the subject line and be sure to include the email address this message was sent to in the body. I cannot remove you if I don't know your address!

>> Thanks in advance for your help.

I know several who have bought the ALS-600 and are very happy. One
Dallas ham bought a second ALS-600. The amp comes with a very heavy
duty PS.

I am waiting on Ameritron and Steve Pan to bring out a 1500W version
altho Lucas Transformer may beat them out. Getting purity is a
problem with solid state amps.

I suspect that ICOM charges the same fee to replace the battery and
reload the EPROM regardless of whether you have tried to do it
yourself, so isn't this one of those situations where you have nothing
to lose by trying it yourself? If you are not a klutz, you would
probably succeed.

>
>All three have too much receiver sensitivity, and are too prone to
>intermod (the Kenwood is the worst of course).

Have you actually tried the DR-610T against intermod, it is certainly the better of all threee, and the best I have seen in it's league. This is the case with or without the Attenuator feature turned on.

>>Important options:
>>1) Crossband Repeat
>
>The Kenwood and Alinco have it for sure, I think the Icom does too.
>It's important to be able to set separate CTCSS tones on the two
>channels during crossband operation, IE has separate encoder and
>decoder, make sure the radio you choose allows that.

The Alinco DR-610T also has one of the fastest switching systems in terms of crossband repeat that I have ever seen.

>>2) 9600 Baud
>
>The Kenwood *clains* to be "9600 ready", but it isn't. The others
>aren't either. The synthesizer designs don't allow proper 9600

>have to go in and modify them for two point modulation, or choose
>a radio that does modulation outside the synthesizer loop, IE IF
>modulation such as the Azden PCS9600D and IC820H use.

I would say that the DR-610 is the best bet if you want 9600 baud ready, remember that Alinco was the first to come 9600 baud ready out of the box with their DR-1200TH2.

>>3) DTMF memory
>
>Don't know about that, don't use it and didn't look.
>Take a look at the Standard dualbander. It is almost

>intermod free, and works better (but still not right)
>for 9600 baud packet than the ones you've chosen.

The DR-610T does have DTMF memories.

In my opinion the DR-610 is the BEST dual band mobile radio on the market and I have lots of people who agree. And I say anyone who doesn't has obviously never owned one.

>improve the linearity of the transfer curve over that of the triode,
>to offer greater power gain in the linear part of the curve, and in
>most cases to avoid the need for neutralization too.

The primary reason tetrodes were developed was to eliminating the Miller effect (increasing input capacitance with increase with the gain in the tube) and to reduce feedback (by lowering grid to anode capacitance). The neutralization and voltage gain statements are correct, the linearity part needs a lot of qualifications attached.

>when any of them reach clipping is the same. And clipping still produces
>only odd order harmonics.

Of course that statement leads me to wonder why amplifiers generate second harmonics. It seems to not apply correctly to the general case being discussed, since hard clipping is certainly not the common source of distortion even at high volume levels.

The actual cause of distortion is the change in slope of the operating load line of the tube.

I suspect one error comes from looking directly at the characteristic curves of a tube, and deciding a more "horizontal" curve (a more constant current with fixed grid voltages as anode voltage is varied) directly predicts distortion. But tubes aren't normally operated at a fixed grid voltages while the anode voltage is varied (except in regulator service). This isn't a good test of linearity.

In reality, grid voltage is varied and this causes the resistance of the anode to cathode path to vary. It is the change (or curve) in the **slope** of this loadline that causes distortion, and that change does not relate directly to the flatness (stability) of anode current when anode voltage is varied with fixed grid voltages.

Each individual tube type has to be compared in a proper operating load line analysis. Some triodes offer very good linearity while some tetrodes may not, and certainly the opposite is also true. Claiming one gender of power grid tube always generates certain distortion characteristics is too non-specific to be a good rule.

The tube's anode to cathode circuit simply becomes a varying resistance that follows the grid current. It is the linearity deviation of the

operating resistance change vs. GRID voltage change that causes distortion, not the "flatness" of anode current as constant grid voltage and varying anode voltage is applied.

I also question the statement that one type of distortion (hard limiting) results in a product that is "out of band" that can be filtered while the other results in unfilterable harmonics. This part should be common sense.

If the signal is well below the upper limit of hearing, NO filter can correct the distortion witout restricting the fidelity. If the signal being clipped or distorted is above the range of hearing, it might as well be left in. I'd like to see someone design a filter that can remove intermodulation distortion of clipping distortion without altering the frequency response of the ampifier. Perhaps someone can suggest exactly how this is done in specific terms and descriptions? Perhaps for two tones of 1000 and 5000 Hz with both mixing and clipping?

Gary, no one has confused those issues except you. This was
apparent in your first post to this thread, in which you said:

"Yeah, the tube amp will have much higher THD. That's why
rock guitarists like them so much, really incredible
distortion effects."

The fact that this reply was in response to a discussion of
normal operating conditions, and that the effect desired by
guitarists only occurs when the amplifier is driven consistently
into the non-linear region, clearly shows that you hadn't made
the distinction.

You went on to say in another post that tube distortion under
normal operating conditions is much higher and more objectionable
than solid-state amplifiers, but then you contradicted your own
logic by saying:

"Even good modern speakers typically have 3% distortion,
and that's lots more than even a cheap amp produces unless
it is grossly overdriven."

When taken together, what you've said is that guitarists prefer
tube amplifiers for their inherently higher distortion under
normal operating conditions, but that the distortion is
inaudible because the speakers are even worse.

I think you need to either explain this or retract it.

>The latter is always undesirable, while the former is
>inevitable when an amplifier is heavily overdriven,

Both types of distortion are inevitable because there is no
perfect amplifier. The difference under discussion is whether
the distortion is less offensive to the ear in a tube type
audio amplifier.

>and can only be ameloriated by good circuit design, IE the
>higher order odd harmonics can be attenuated by suitable
>output filtering.

Did I miss something? If those harmonics occur at audible frequencies, any attempt to filter them out will also remove desired signals!

>The output transformer can serve that purpose for most tube >amplifiers.

Considering that you've now made this claim several times, I'd like to hear an explanation as to how the transformer can filter audible, undesired harmonics without also attenuating desired signals at those same frequencies.

At this point, I also suggest that we stop applying the term "clipping" to tube type amplifiers. I've been as guilty of this as anyone, but it's not accurate. "Clipping" implies that a scissors-like cut has been made across the top of the waveform as observed on a scope. That's not what happens in a tube amplifier and I'm not sure the term was even coined until the advent of solid state designs.

It would be much more accurate to simply refer to "overdriving the amplifier". That phrase that can be applied equally well to both types.

I have the 7500h. Clipping diode 127 (I think) opens it up. It will go down to 37m but mine unlocks on TX. Probably could be re-tuned for use there.

Another mod I came up with is for the beep. Whenever you touch any of the buttons on the rig, it beeps. Really sucks too. There is a connector that runs from the faceplate to the main board. Clip and insulate the green wire (green on mine), but refer to your schematics for the one that is labeled "beep".

If I had it to do over again, I would not buy the Azden. Not worth it. When you hold the up or down button to scan around, it stays on the prvious freq untill you release the button. In otherwords, if I was on 52.525 and held the up button till the display read 53.010, it will continue to receive 52.525 untill I release the button. Really sucks to have to push the button a million times when tuning around for a signal.

Possible, yes. Legal, probably not. In many countries, including the US,
radios have to be "type accepted" for specific services. Use of amateur
gear outside the ham bands is usually illegal.

There are various brands of very inexpensive VHF handhelds available for
the use you seek -- they are much less costly than ham gear, are easier
to use, and are fully legal.

Good hunting...

1853. IC-706 Yellow Wire Mod -- Con?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-03 00:00:00 UTC
From: "Chris Smith, NR3O" <csmith1@ccgate.hac.com>
Message-ID: <4mdfvb$pn@newsroom.HITC.COM>
Source record: 201840

I wanted to know more about "the yellow wire mod" for the IC-706 (the "yellow wire mod" was advertised on the Internet as a means to improve the receive operation of the 706 outside the ham bands in the VHF range)

Here's what Icom had to say:

ICOM stopped advertising and actually changed the specifications for wide receive in July 1995. The radio receive range is advertised from 30 KHz to 120 MHz and 144 to 148 MHz, and it is only guaranteed with in the Amateur Bands. We are fully aware there was still some brochures claiming full receive from 30 KHz to 200 MHz. We will not modify nor embrace this " yellow wire " modification. Doing this modification violates the FCC Part 15 Type Acceptance of the radio. We can not legally do this modification.

When you clip the Yellow wire, you turn off a filter that is designed to retain receiver radiation within the receiver, also you leave a transistor base floating. If troubles arise and are directly caused by this modification, the warranty will be void and the customer will assume responsibility for the cost of repairs.

Gary Fiber
ICOM America, Inc

(I don't particulary care if my 706 receiver "radiates"--I am still wondering if the mod works and is worth the "risk" of voiding the warranty.)

Hi,

I am in the market for a mid-range HF rig. I've been looking at some of the Kenwood TS-series and they look good. Also been looking at some Icoms. Don't know much about Yaesu though. In particular I am wondering if there are any problems with the TS450S/AT. What is the Icom model that is closest to this? What about the Icom IC-728? If someone can recommend me a good rig, not necessarily contest grade but decent and reliable, I would really appreciate it. I am a little wary about Kenwood because of their notorious reputation with their VHF sets. Thanks in advance.

73 de 9V1ZV Daniel

p.s. If you can let me know how much to expect for them I would be grateful.

Make sure the mark is 2125 and the space 2295. The KAM defaults to 1600/1800.
You may also need to offset the IF Shift or Passband tuning a little to the
high side. I have to do this with my ICOM IC-765 to "peak" the tones.

As I noted in the part you cut, 152 dba is obviously ridiculous,
which is why you have to restrict the musical span you can reproduce
to less than the full 90 db offered by a CD. You have to let the
bottom end of the range mush down into the room noise, and limit
or clip the highest end of the range to avoid obviously ridiculous
power levels well beyond the threshold of pain. That still leaves
you with a range sufficient to require at least 13 db of dynamics.
And if the average level requires 40 watts, then the transient
would require 800 watts. Note well that those are just example
numbers, and not necessarily representative of a particular
system.

>In addition, the total dynamic range of the orchestra (from
>pianissimo to fortissimo) will be approximately 80-85 dB.

Ok. I don't know what reference you're using for that scale.
I was using the A weighted scale on my sound level meter which
is in dba, where 'a' corresponds to a certain audio power level
at the microphone input stated in something like microbars or
whatever (the calibration sheet isn't handy). Looks like you're
using the threshold of hearing as a reference, but that's rather
dependent on individual hearing.

I think your quiet room number is too low, but I'll accept it
since it makes the dynamic problem worse. Instead of a 40 db
span as I postulated, we're now faced with reproducing a 80 db
dynamic span.

>>Now a comfortable listening level is 80 dba, and that centers
>>you in the usable range. If it takes 40 watts to maintain that

>approximately 40 watts, not the 800 watts previously claimed.

But you're talking *acoustic* watts, not electrical watts. Taking
the number of 179 electrical watts to generate one acoustical
watt you quote below for a sealed air suspension speaker, and
scaling by 10 db to give your 80 db SPL, we have 17.9 electrical
watts required from the amplifier. To reproduce a 20 db transient
above that, 100 db SPL, would require 1790 electrical watts. That's
even worse than my example.

>than 100 watts at the point where peaks approach this speaker's
>limit. Using the example of the orchestra again, peaks at 400
>watts would indicate a maximum average power that is 20 dB below
>that, or 4 watts.

Some sort of logical error must have sneaked in there somewhere, above
you are postulating it taking 1 acoustic watt to deliver 90 db SPL, which
would be 20 db below the stated 115 db for the symphony in your db chart.
Now 1 acoustic watt is 179 electrical watts according to you, and I'd say
that sounds right. Now that's only -3.49 db below 400 watts, not 20 db.
I believe you're being inconsistent in your use of acoustical watts and

electrical watts in your calculations.

Lets agree that 179 electrical watts gives us a 1 meter 90 db SPL,
and work all our numbers from there in strictly electrical watts.
To get to 115 db SPL, we'd need 428,679 watts. Since that's rather
absurd, it would appear that we aren't going to achieve synphonic
levels out of a single cone air suspension speaker. I'm not surprised.
To achieve those levels at a concert, we find a huge stack of speakers
driven by multiple amplifiers.

Now working the other way, to reach a room noise floor of 35 db SPL,
we need an electrical power -55 db below 179 electrical watts, or
4.07E-13 watts, or 0.4 picowatts. This is why I'm dubious of the
35 db number for a quiet room, that's a ridiculously low power.
If we take my sound meter's number of 62 db for a quiet room, we
only have to drop the 179 watts by -28 db, giving a power of 4.92E-7,
or 0.49 microwatts. That still seems awfully low, but perhaps it is
real, you can hear a crystal radio after all.

It appears that there's been some confusion between acoustic and
electrical watts, and confusion between what our dbs are referenced
to going on here. I'm not sure I've got it straight yet. But it
looks a bit more reasonable now.

Gary

There's no technical content to that at all, Tom. That's because it
wasn't in response to a technical point. I was responding to Joe's
post about flamage in this thread.

Statement 1 is simply true. You admitted not having seen the MLA2500
article before posting critcisms of it.

Statement 2 is my (extreme) opinion about that. On reflection, I
shouldn't hold you to professional standards in a post to an amateur
newsgroup.

Statement 3 is my opinion of your attitude throughout this thread.
I'm at a loss as to why you seemed to react so strongly to this
business with Svetlana. It appears to me you must have a motive
beyond what you've written.

Statement 4 is a snippy cheap shot. I don't know whether you get
free samples or not.

The resistor is not bypassed. It is used for degenerative feedback.
That's how the stage gain is held so low.

>Such circuitry also causes phase delays in the cathode bias voltage and
>can and usually does produce non-linearity. The effect is that the bias
>"looks correct" during a single tone test, or an incomplete paper

I think you're still talking about a *bypassed* cathode resistor.
This isn't.

>If the cathode resistor of an AB1 amplifier is properly unbypassed, the
>cathode adds correct phase negative feedback, and subtracts from the grid
>drive voltage at a rate of between 1.414 and 2.818 times the metered plate
>current (plus the screen current). This system lowers efficiency but
>greatly improves IMD performance. This effect is inherent in grounded grid
>amplifiers but doesn't necessairily hurt efficiency in them.

Yes. Stage gain is depressed, only 10.97 db, but efficiency still doesn't
look bad. I believe the calculated value was 62.5%. I've seen better, but

that sure isn't bad.

>>Obviously, the 68 db product for a *single* tone, is the third
>>*harmonic* level of the amplifier when driven CW fashion. Product
>>in this case may be a poor choice of words. It is a product of the
>>amplifier, but it isn't a product in the conventional mixing sense.
>
>Product is the wrong word, the correct word is HARMONIC. And harmonic has
>nothing directly to do with the type of tube used. I believe that was the
>incorrect point you made, that the 68 dB had something to do with the fact
>it was a tetrode?

No, I don't think I said that. I was just reporting what I read off
the graphs on oak.oakland.edu for the ARRL lab tests. However, it
may still be true. The tank circuit of this amp doesn't offer that
much harmonic suppression by itself, I know, I have one with 8875s
still in it. So the tetrode modification may be contributing to the
good harmonic output. More linear? Better input match? I don't know.
But that is a better number than the stock amp. (The input match
of the stock amp is pretty poor on some frequencies, requiring me
to resort to a tuner between the rig and the amp to prevent the
rig from going into SWR foldback. It would appear that the 50 ohm
input resistor of the modified amp offers a pretty flat load for
the exciter.)

>>This isn't IMD. The IMD number is for the two tone test, of course.
>>The first two products in that case are spaced at 2 kHz and 4 kHz
>>from the (suppressed) carrier frequency, and are -38 db and -48 db
>>respectively.
>
>Again the details are somewhat lacking, dB what? Below a single tone or
>the peak output?

Below the two tone level. Again, I'd urge you to go to oak.oakland.edu
and look at the ARRL lab report yourself. If I'm misinterpreting the
graphs, I'm sure you'll hurry back and tell us.

>-38 db isn't spectacular, an 8877 or 3CX800 will do much better than that
>in a fixed power level two tone test. I've measured 8877's at over -43 dB
>below PEP for third order and -52 dB in a fixed two tone test. A two tone
>fixed power level test isn't accurate for evaluating SSB, in particular
>with tetrodes.
>
>All of that aside, where is the big "tetrode distortion advantage" you
>touted while being so openly critical of my technical analysis and
>ability? It certainly doesn't appear in those numbers!

The numbers are better than the original amplifier with 8875s. Now I
didn't say that the modification was optimum did I? I don't think so.
If someone started with a clean sheet of paper, I'm confident better
performance numbers could be obtained. As I'm sure you are well aware,
more than just the number of grids in the active device are involved

in achieving a clean amplifier.

This modification appears reasonably easy to do, saves a good bit of money compared to a new pair of 8875s, and has better measured performance in important areas than the original amplifier. That looks like a good deal to me. If the ARRL lab test results showed worse performance than the unmodified amplifier, I'd tend to go along with you in your criticisms. But that's not the case. There may be a different modification one could make that would result in even less expense and even better performance, but the given modification looks like an improvement to me.

I've been critical of your technical analysis because you haven't even read the article or looked at the ARRL lab report. If you had, you'd have noticed that the cathode resistor is not bypassed, and you'd have made sense out of my attempt to describe what the graphs show. There may be things wrong with this modification that I don't see (besides the obvious discrepancy between text and schematic for the cathode resistor value), but I can't take seriously a technical analysis of a circuit you haven't even seen, especially when it is based on incorrect assumptions about the circuit. I get the distinct impression that you've assumed the designer of this modification must be stupid. How about assuming instead that he was reasonably astute? (You can feel free to accuse me of being stupid for attempting to describe the article to you.)

I've also been critical of you because you seemed to have a kneejerk reaction to the mention of Svetlana in this article and the original one. Now I don't know why that is, but I find it difficult to believe that it is merely a matter of a technical difference of opinion about the relative merits of triodes versus tetrodes. Why do you think they bother to put that extra grid in there if it doesn't offer some advantage? Why do you think designers at Harris, RCA, Gates, Collins, etc bothered to use tetrodes if they are inferior performers? Is it because they just liked to design screen supplies?

1868. Re IC 706 hand mic improvements

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-04 00:00:00 UTC
From: cbuttsch@slonet.ORG
Message-ID: <Pine.SOL.3.93.960504085456.14334A-100000@spork.callamer.com>
Source record: 201668

The supplied hand microphone issued with the IC706 has very little low frequency response probably suited best to the Japanese voice. To minimize this effect, select MENU Q4 (carrier frq) ssb only, and change the default to minus 200. This will retain some low frequencies. Do not use the compressor (COMP) as this will also eliminate lows. At least these changes will allows the "rag chew" guys to get off your back until another microphone can be fitted! 73 Cliff W6HDO Morro Bay, CA

Thanx for the tips Clint but I already had that from the last time it was posted. What I'm trying to figure now is when in M-VFo mode and I hit M-Set and run thru the menu items I get to set a bunch of things such as:

oS(which I figured out is the Repeater offset)
Ar
Lb
To
tE
P5
ud
5d
Sc
Sr
rc(which I figured out is PLL decode)
tc(PLL to Tx)

These setting are most vexing. Thanx for the help and info.

I am looking for anyone who might have an interest in
BA1404 through hole Stereo Transmitter Chips. I worked for this
company that was contracted to create a FM-stereo transmitter for
oanother company that was using it for commercial use. I helped
design a board and had it FCC approved through Bell Labs.
After ordering 1000 units the company was satisfied yet
their need was fulfilled. I had anticipated 2000 units and ordered
an extra 1000 IC's since the manufacturer back-ordered 5000 for
6 months.
I now have 1000 BA1404 chips to sell if anyone is interested.
I also have 100 crystals and varialbe inductors for the FCC approved
design. If you or anyone you know would be interested please let me
know. I will also give schematics if desired.

dc@interaccess.com
Doug

P.S. I would like to sell them as 1 package but will consider breaking
them up in quantity.

Source record: 201678

If I remember correctly from a few years back, the raysistor was a package containing an incandescent lamp and a photocell (cadmium sulfide I think). The resistance of the photocell changes in proportion to the amount of light coming from the lamp so it's an optically coupled, current controlled variable resistor. It was used in such applications as remotely controlled gain controls and as the gain control element in automatic gain control circuits. If you're interested in specs I may still have a data sheet filed away at work (I try hard never to throw anything away!).

>including the 800-MHz. band?
>
>Thanks, Bill Crocker

There were 2 good ones about 4 years ago by Icom, the IC-2SRA and IC-4SRA.
These were dual band HT's in almost every respect except they could only transmit
on one band and the other was dedicated soley to receive 50-905 continuous.

You may remember it as the only HT to my knowledge that had 2 seperate
antenna's coming out of it! The receiver section was a cheap knock-off of
the IC-R1 scanner.

These are still around for about $325 used.
]
Good luck.

1889. Kenwood TM-742 questions...

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-04 00:00:00 UTC
From: srwhite@ibm.net
Message-ID: <4meg35$3vn0@news-s01.ny.us.ibm.net>
Source record: 201850

I just bought a new TM-742 and have the extended TX mods for it and the 800MHz RX and extra 100ch mods and I can't get the latter 2 to work...

My question is does the extended TX mod have to be done to get 800MHz to work?? I can't even get the rig to tune in the 800 range in the display.

As for the extra memories, the mod says in memory mode hold down F and REV. Extra mem's A1-J0. BUT, I can't seem to tune to them or be able to write to them.

Also any tricks like real-time DTMF monitoring, games, etc. would be appriciated. I have tries the the CD-ROM sites and oakland for the info that I have now as well as the ARTSCI mod book.

Thanks!

The Raymond Sarrio Company's Ham Radio WWW site is proud to announce a FREE Ham Radio classified advertising page at http://www.sarrio.com

This new classified section will allow Hams to search for equipement with the help of a search engine--no need to scroll through 100's of listing before you find that special piece of gear. Plus, when you find the gear your interested in, each listing comes with point-and-click e-mail access, direct to the Ham that listed the item.

For those Hams with gear to sell, take note! It is absolutely FREE to list your equipment within Ham Classifieds, and there will be no posting time delays. Your posting will go on-line, in our classified search engine, immediately. All you need do is fill out a simple forms page, and upon its (point-and-click) submission, your "For Sale" advertisement is on-line within 1 hour. I will be purging the classified listing initially about once every month, but that timeline will shorten as our classified numbers go up. Give it a try, and let me know how you like it. 73's Ray

Hi Feroz:

The menus that one accesses through NR + LSB/USB (+PWR ON) are not actually "hidden". These are standard Service Adjustment Mode menus and are described in the Service Manual for the TS-870S.

As for the menus associated with NR + CW/-R... sorry, I would like to know as well!

I recently bought a FT-40R to use in Search and Rescue. The radio was previously converted and I did a master cpu reset. After the reset the radio went back to 430.00 to 450.00. I was wondering if anyone knew the sequence of buttons to push to bring back the extended rx/tx? Thanks ...Ray KC6FUA.

1903. HTX-202 Warning.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-05 00:00:00 UTC
From: midgard@nycmetro.com
Message-ID: <1521.6699T928T1528@nycmetro.com>
Source record: 201614

Okie folks, don't know if this has been mentioned before or has happened to anyone else before but here goes.....

I recently bought a RS HTX-202 2 meter HT from the net, arrived as advertised and all was good with the world (Thanx to Bill Coyle!)

Anyway the warning I have is this. Make SURE to check the Ferrule on the HTX-202's BNC connector for the Antenna. Mine worked itself loose then due to my negligence I had it strapped on my belt to the back of my body. When I jumped into my truck I likely flexed the antenna and the BNC connector. We had LOUSY weather here yesterday so I chalked up the horrible reception to this. Today we Had gorgeous weather and still recieved Nothing. Opened up the Radio(the Screws seem to be made of some REALLY crappy steel and the heads are easily torn up even with a good jewelers screwdriver being used) and looked at the connection to the BNC Antenna Jack and sure enuff the lead from the PCB to the BNC was broken. A couple of minutes with a soldering iron and it was fixed but it's pretty tight in there so I'd rather not do this again ;-)

Hope this saves someone else from having the same problem I did.

Remember Check them Ferrules!!!!! NOW!!! ;-)

> what's wrong.
>
> It's supposed to work :-)

Hi Lawrence:

It's been a long time since I've played with a TS-930, but I suspect that aging of the carrier oscillators (CAR 1-4) may have caused them to drift sufficiently that both "mark" and "space" no longer fall within the 500Hz bandwidth of the filters (a not uncommon problem in the TS-940). You should be able to get a pretty good idea of how the filters are responding by tuning to a marker frequency and noting the S-meter action when the dial is tuned to produce the requisite 2125/2295 Hz audio outputs. If one or the other of these tones cannot be achieved with the S-meter at or near a peak reading, you should perform Steps 1-4 & 8 of the RX Adjustment section of the Service Manual. Hopefully, this should correct the problem.

Also, it is very likely that use of the VBT with these narrow filters will quickly reduce the effective bandwidth to less than is needed for good FSK. But this effect of the VBT can be checked as suggested above: See how far you can advance the VBT and still pass both the 2125 & 2295 Hz signals and still maintain a full S-meter reading for both.

Good luck & regards,
Keith (KS9C)

You will probably get the best overall effect by utilizing the 500 Hz filters (with no VBT) together with the outboard DSP when needed!

>Also are there any mods??
>
>Thanks..

I have one it gets good on air reports and has a pretty hot receiver. The down side. Alinco is at best non-responsive the noise blanker is non exsistant even after the factory mod. There are "MARS/CAP" mods. Most of the response problems seem to lie in Japan and at times Alinco America seems as frustrated as anyone. The six meter section is an inigma so far there have been no band openings when I was using the radio. The FM section of 6 is so noisy as to be unusable. The concept of having two antenna connectors for HF and 6 makes a lot of sense but I would guess it is just because the final amplifier transistors are not used on 6 rather than a thoughtful design. There are "filters" on all modes save FM but they are not lattice filters but rather some type of capacitive audio device. They are reminscent of the audio filters sold before the advent of DSP. Accessories are the typical Pacific Rim Ripoff but are comming down as pressure from the IC-706 is being felt. Currently you get a remote kit and a mobile mount when you buy the radio. This is no big deal as you should get these things anyway. If you happened to foolishly buy your DX-70 before the new lower price and give aways tough luck they don't even answer email about the accessories. All in all the radio is OK but it will be my last Alinco the attitude and service are so much better at Yaesu I'll just spend my money there. Hope this helps.

RE: PHD 1996 KC MIDWEST AMATEUR RADIO CONVENTION

Anybody out there catch the "big" hamfest in Kansas City this
past Saturday (May 4)? This was the one held at I-435 and Front Street.

Was anybody a bit disapointed with this get together?

Where were the big three Japanese equipment manufacturers? I cruised
the entire show and didn't see one single booth. No literature, no
demonstrations of the latest gear!

As for the flea market, I am wondering why there was no outside
"tailgate" flea market space. I also noticed that there was mostly junk
equipment for sale at the inside flea market ($20/table), most of which was
worn out and dirty or else bought from Fair Radio and then jacked up in
price about 25 percent.

Didn't see any National. Didn't see the first piece of Collins gear.
As for Hammarlund...the only piece on display was an HQ-110 that
was not operational and grossly overpriced.
Have the collectors and overseas buyers finally hoarded ALL of the
good stuff?

What exactly did we get for the money spent on admission?

Also noticed that about 25% of the flea market was taken up with old,
outdated computer junk that no one really wanted. Did not see much of
the older Japanese radio gear for sale.

The last ham convention that I attended was almost 10 years ago in Atlanta.
Quite a different story there. Have things really changed that much
in 10 years?

You input on this will probably enlighted others out there in addition to
myself.

Remember, this was a hamfest held in a major metro area! This all
makes me wonder what the really big hamfest (Dayton) was like?
Is Kansas City just a sucky place for a hamfest, or is the hobby of ham
radio slowly slipping away?

Anyone?

I have had my FT-757 for over seven years and it works great. The other day I was transmitting and notice that my cooling fan had not kicked in, the heat sink was very hot!

Later, I let the rig run full power (into a DL) for six minutes and the cooling fan did not kick it.

Can someone on the group try this and see it at work point the cooling fan kicks in? I don't transmit much so I don't remember when the fan comes on.

I did check the fan and it worked with 9V across it. I hate to go into the PA so I may just hardwire the fan.

Thanks

What ever happen to the FoX-Tango club? Are there any Yaesu nets? I owned a FT-101EE and it was a very good radio, except for the mechnical relay that kicked in/out for TX/RX. Having headphones on, I would hear a very loud pop!

Upgraded to the FT-757 and still have and use it.

From: bluospry@ix.netcom.com
Message-ID: <4mjbkc$pd4@dfw-ixnews1.ix.netcom.com>
Source record: 201627

Buying the right HT
IMHO all of the ham radio companies are good. Usually the latest radios out have some new features and advantages. But it depends on where you live, how you'er going to use it, what you can pay, and what repeater club you belong to that really matters. You should buy an HT suited to your specific needs.
If you want to use it in the distance wilderness you will want a telescoping 1/2 wave antenna, a maximun voltage battery pack (13.2v, 12v or 9.6v depending on the radio), and a radio that puts out 5 to 7 watts. You may want to add a walking stick beam antenna (Arrow Antenna, 1461 Peacock Pl., Loveland CO 80537) if you get even more remote. Bigger batteries, antennas and radios become valuable for remote communications.
Picking bands is simple look in the repeater guide to see which bands have the most open repeaters and where the high coverage mountain top repeaters exist (the maps of repeaters show many of these). In terms of HTs 2 meter propagates better then 1 1/4 meter which is better then 70 cm which is much better then 1.2 gHz. But in underground parking structures the trend reverses. In most areas 2 meter is best and 1 1/4 or 70 cm is second best. In California there are interstate nets two run on 1 1/4 meter through most of the state except the northern extreme into western Arizona and Nevada and one in the southeast desert of California on 2 meter into Arizona, New Mexico and western Texas. Check what nets you might want to use. Finally decide what repeater group you will join and what bands are best for that club. Pick the best bands for your area and use.
Picking the size of the radio depends on how much you will use it in the big city. Small radios typically have more intermodulation problems, bad for the big city, then the larger Hts. But intermodulation is rarely a problem in the suburbs or afield.
Will you try to use the HT in a vehicle? If you have a very small amp and speaker, typical of the shirt pocket variety, you will need and external audio amp and speaker to hear it in your car. But the larger amp and speakers of the bigger HTs can easily be heard in the moving vehicle. You could of course have a shirt pocket HT and a mobile transceiver in your car. Pick a size of HT that fits your needs.
Some radios have 12 memories and others 200 memories; if there are hundreds of repeaters in the general area of your travels you may want more memories to prevent constant reprogaming. For limited travel in remote areas a dozen memories is fine. Pick the right amount of memories.
Are you going to use the radio at night in the dark? Then you may want a HT that has a key display that is lighted on command.
Most new HT s have CTCSS, tone and paging but in general be aware of

the rest of the features and if they would be of use to you. After you have answered these questions look in the catalogues and match up the HTs with the proper features considering of course your pocketbook. My personal choices were a Standard C228A (2 m / 1 1/4 m, my preferred radio), a Radio Shack HTX-202 (a powerful radio in audio and transmit), and a Standard C558A (2 m / 70 cm) used only when I need a compact radio.
If you get a radio made by a non-commercial manufacturer (Standard and Mortorola make the commercial radios) put some (loc-tight) on the threads of the BNC connector as this sometimes comes loose on hand held radios and might cause the BNC to pull away from the solder joint inside the radio thus breaking the antenna connection!

>
>Gary Fiber
>ICOM America, Inc
>
>(I don't particulary care if my 706 receiver "radiates"--I am still wondering if the mod
>works and is worth the "risk" of voiding the warranty.)

The yellow wire mod works, and was apparently circulated by someone within
Icom America itself shortly after the radio came out. My first reaction on
reading this was to say "Hogwash!", but then I thought that maybe I ought
to do some investigation first.

If you examine the circuit, not one but two preamp stages are between
the antenna input and the first mixer, and not one but two low pass
filters are between the input and the first LO, not counting the HP/LP
filter combination used for wide receive. When you do the yellow wire mod,
you insert a bandpass filter (the 2m filter) in the signal path all the
time instead of the "wider" filter Icom originally intended for operation
outside of 2m.

Now we're asked to believe that LO leaks back through two preamps
(indicating the preamp design has poor S21 characteristics), two
low pass filters (the radio uses high side injection), and through
the 2m bandpass filter in sufficient amount to violate Part 15
standards when you're doing receiving above 2m (the purpose of the

mod), but not when you're operating 2m and the LO is closer in frequency to the filter passband center.

So I decided to drag out the old Tek spectrum analyzer and check this out. To put it nicely, my first reaction to exclaim "hogwash!" would seem to be vindicated. There is no LO re-radiation exceeding -100 dbm (the noise floor of my analyzer) when you tune above 2m after the "yellow wire mod" (or more precisely in my case a more extensive modification that extends receive all the way up to 200 MHz as originally advertised, the yellow wire mod peters out above 165 MHz).

But I decided to poke around a bit more. The dangerous area would appear to be tuning in the 74-78 MHz area where the LO falls *within* the 2m band, and is thus centered on the lowest insertion loss portion of the 2m bandpass filter. You can check for this by listening with a HT cabled to the VHF connector of the IC-706 while tuning this range (don't transmit!). Sure enough, there's a detectable signal at the connector. It's below -80 dbm, but it is there. What's more interesting, however, is that if you put a good quality dummy load directly on the VHF port and wave your HT around the *case* of the radio, the signal seems even stronger. This leads me to believe that the oscillator signal is not coming *through* the filter, but rather *around* the filter, yellow wire mod or no yellow wire mod.

Somebody who *hasn't* modified their IC-706 yet please try this test. Tune the IC-706 to 75.352 MHz and listen on 144.365 MHz with your HT for LO leakage. Report back here what you hear.

Now this is only a sample of one, your radio may vary. I don't think you can get in trouble, however, if you do the yellow wire mod and use it to tune above 2m. It is barely possible you could have a problem if you tuned around just below the FM broadcast band, but I doubt it. If my radio is typical, I believe you're still within the Part 15 standard, but I don't have the relevant Part 15 standard in front of me and I could be wrong. I couldn't kerchunk any of the local 2m repeaters with this re-radiation, even when the radio was connected to my 2x4Max gain colinear at 70 feet. I'm full quieting into one of those machines with the 260 mW of my C508A on its rubber dummy load at ground level to give a point of comparison.

My opinion, for what it is worth, is that Icom was getting too many of these rigs back in for warranty repair after someone butchered the mod, and found an excuse to disallow it. I don't have any quarrel with that, when you start poking around inside a radio making changes, the manufacturer can't be liable for the quality of your work. But I don't think Part 15 really has anything to do with it (other than maybe that Icom would have to recertify the radio with the mod in place). If I'm right, there's more LO leakage from the *case* of the radio than out the antenna connector, mod or no mod.

If you're concerned about your warranty, you've been warned that doing the mod will void it. But if you don't care about that, I think the

mod is still within good (amateur) engineering practice. And it does
let you receive the NOAA Wx transmissions with reasonable sensitivity.

>problem creeps in. The tube is moved closer to cut-off if the cathode is
>not allowed to return to ground at during the neagtive grid portion of
>each cycle exactly in step with the RF signal!

I obviously don't know the value of stray capacitance between cathode
and ground in this modified amp (nothing is said about it in the
article), but there's no deliberate capacitance there. And given
that T=R*C, and R is fixed at 30 (or 20) ohms, the value of stray
C would have to be substantial to have any effect at syllabic rates.

>For example, consider a class AB amplifier at the edge of cutoff. Adding a
>few volts of positive cathode voltage not only reduces the effective
>current by increasing the bias voltage, it also reduces the effective
>screen voltage. Moving the screen to cathode voltage around carelessly at
>an audio rate is absolutely the last thing that should be done in a SSB
>amplifier.

Yes, but moving it around on purpose may be useful. Consider that
screen voltage controls stage gain in a tetrode. By varying screen
voltage in step with drive, you get a gain control effect in accordance
with the 3/2 power rule, IE speech compression for "free" without the
use of external ALC. The author claims that no external ALC is required.
There's a 0.1 uf cap in parallel with a 180k resistor shown connected
right at the screen. That has a time constant of 0.018 second which would
seem to smooth response above the syllabic rate, IE above 95 Hz.

>Raising the cathode voltage moves the tube rapidly towards class C
>operation, increasing efficiency and decreasing linearity. This effect is
>indicated by Svetlana's specifications for the 4CX1600, which shows
>efficiency rising from 61 to 72 %, and IMD increasing from -36 dB (below a
>single tone of a two tone test) to -30 dB when a catode resistor is added
>to a 4CX1600!

OTOH, the author of the article quotes the Swetlana data sheet for their
4CX800A as yielding a 3 db *improvement* in 5th order IMD with the addition
of the cathode resistor. I just went back and examined the ARRL lab report
graphs again. In what I hope is proper terminology, here's what I see.

3rd order -41 db
5th order -38 db

7th order -55 db

All figures are db down from one tone of the two tone test signal, and
are interpolations from the graph. They might be off a db one way or
the other due to my interpolation. It appears to me that the author's
meaning might have been reversed in the text of the article since 5th
order products are the worst of the three. But the relevant point to
me is that these are actual test results from what we should hope is
a relatively unbiased source.

>Gary's text called my attention to yet another very good reason why the
>correct grid resistor should have been selected in these articles, rather
>than the addition of a simple cathode resistance to correct a grid loading
>error.

Again you're assuming the author of the article is stupid. Assume
instead that my attempt at explaining the article to you is what's
stupid. Now if the author indeed knows what he's doing (he is a Phd
with extensive tetrode experience according to the bio), the use of
a cathode resistor is *not* to cover up an error. In fact, in the
text he stresses the reasons he chose to use a cathode resistor
in the circuit, primarily to obviate the need for ALC and to use
negative feedback to improve amplifier linearity. The hopefully
correct two tone test data I've entered above would tend to confirm
his choice wouldn't you say?

>The more technical information I hear about the two articles Gary
>mentioned, the more questions I have about the effort actually made to
>design a clean HF amplifier. Tetrode design is complex and must be
>carefully done to avoid unwanted distortion.

If you've dropped your ARRL membership for some reason, I'll be
happy to go down to HRO and *buy* a copy of the magazine for
you and send it to you. As long as you won't read the actual
article, you're shooting wildly in the dark.

Message-ID: <318C7F6F.53BC@rational.com>
Source record: 201695

While attempting to break an 80m cw pileup with the DX working split, a local DXer asked me via packetcluster to kindly stop transmitting on the DX's frequency. While operating my new 775 was not yet second nature, I was sure I had the radio was in split mode, and quickly verified that to be the case. Later experiments revealed the problem - in split mode, the 775 was transmitting on the "receive" vfo as well as the "transmit" vfo, about 30-40 db down.

I called Icom Service the next morning and was told that this was known problem suffered by some but not all 775s; they refer to it as the "receive interaction problem". HRO, where I bought the radio, expeditiously returned my 775 to Icom Service, and the radio was back in my shack in ten days - with no more receive interaction.

If you've got a 775, you might ask a friend to check your receive frequency while you transmit in split mode. Your fellow DXers with thank you...

Actually I made two typo's (or thoughtpo's) the 30L1/S1 thing and another
when I mentioned a "4CX1600" when I intended to say "3CX1500".

You may want to check out the new Yaesu dual band 50R. It's very small in size,5w output, exellent audio, wide band coverage (76-200,200-540,590-999), mil-spec 810.

>I didn't expect they would lost connection !
> Can anyone help ? Are there special instructions required ?

> Your help will be very much appreciated. Thankyou.

You've got a misconception as to the function of KISS mode. The purpose of KISS is to provide a way for a computer and software to be able to manage the mechanics of the connection, with the TNC providing only a minimal level of intellegence. All the TNC does is:

1) accept packets from the host computer and send them on the air, while making sure the channel is clear before keying the radio.
2) receiving all packets on the channel that don't have errors and passing all of them to the computer for it to process.

So - to use KISS mode, you have to have software running in the computer that implements the layer 2 protocol you wish to use on the air (typically AX.25). It can also implement other protocol layers above 2 by wrapping those packets in the layer 2 protocol. This is what KA9Q NOS and its variants do.

So - to summarize, a TNC in KISS mode does not exhibit any significant level of intellegence - the reason KISS is available is for those who wish to have the computer perform link management activities - i.e. do all the work...

Hope this helps.

Regards, Bob

Subject: BA1404 fm-stereo transmitter chip

I am looking for anyone who might have an interest in
BA1404 through hole Stereo Transmitter Chips. I worked for this
company that was contracted to create a FM-stereo transmitter for
oanother company that was using it for commercial use. I helped
design a board and had it FCC approved through Bell Labs.
After ordering 1000 units the company was satisfied yet
their need was fulfilled. I had anticipated 2000 units and ordered
an extra 1000 IC's since the manufacturer back-ordered 5000 for
6 months.
I now have 1000 BA1404 chips to sell if anyone is interested.
I also have 100 crystals and varialbe inductors for the FCC approved
design. If you or anyone you know would be interested please let me
know. I will also give schematics if desired.

dc@interaccess.com
Doug

P.S. I would like to sell them as 1 package but will consider breaking
them up in quantity.

says...
>
>How ?
I had a problem with my 51r - the contrast was getting pretty bad, and
some of
the LCD segments were unreadable in the cold. I sent it back to Yaesu,
and
they replaced the display. Now it works just fine, although when it's
dark,
and the backlight is on, it's best when looking straight on.

Good luck w/ you unit.

From: billn9hh@aol.com (BillN9HH)
Subject: ICOM AH-2 Info Please

I don't know if they are identical internally, but functionally, the
AH-2
and AH-3 tuners are equivalent. The AH-2 has an external controller
that
connects to the rigs computer interface and ALC lines for control while
band changing and tuning up. This interface is used with rigs such as

the
IC735. Most newer ICOM (IC737, etc) rigs have the ability to control
the
tuner directly thru a four pin molex connector that matches the one on
the
AH-2. I'm using an AH-2 with a 737 and it works just fine. When the
AH-2
is plugged in, the 737's internal tuner is disabled.

Have not tried it, but think you could go ahead and use the external
controller with these newer rigs, in which case any internal antenna
tuner
would still function, giving and even wider matching range.

I don't think extending the control cable a reasonable amount would be a
problem.

From: Bob Ludlum <brlpe@worldnet.att.net>
Subject: Raytheon Raysistors

If I remember correctly from a few years back, the raysistor was a package containing an incandescent lamp and a photocell (cadmium sulfide

I think). The resistance of the photocell changes in proportion to the amount of light coming from the lamp so it's an optically coupled, current controlled variable resistor. It was used in such applications as remotely controlled gain controls and as the gain control
element in automatic gain control circuits. If you're interested in specs
I may still have a data sheet filed away at work (I try hard never to throw anything away!).

I'd go down to the radio store and get a Communications Specialists SS-32 encode-only CTCSS encoder. The frequencies are dip-switch selectable.

I have built my own CTCSS encoders in the past, but the 1% resistors are usually hard to track down -- stability of CTCSS tones if VERY important because they should be accurate and stable to a tenth of a Hertz, 100.0 Hz in your case.

Date: Sun, 05 May 1996 03:14:07 -0700
From: Dave Bernstein <dhb@rational.com>
Subject: Icom 775 problem and fix

While attempting to break an 80m cw pileup with the DX working split, a local DXer asked me via packetcluster to kindly stop transmitting on the DX's frequency. While operating my new 775 was not yet second nature, I was sure I had the radio was in split mode, and quickly verified that to be the case. Later experiments revealed the problem - in split mode, the 775 was transmitting on the "receive" vfo as well as the "transmit" vfo, about 30-40 db down.

I called Icom Service the next morning and was told that this was known problem suffered by some but not all 775s; they refer to it as the "receive interaction problem". HRO, where I bought the radio, expeditiously returned my 775 to Icom Service, and the radio was back in my shack in ten days - with no more receive interaction.

If you've got a 775, you might ask a friend to check your receive frequency while you transmit in split mode. Your fellow DXers with thank you...

From: Dave Bernstein <dhb@rational.com>
Subject: Icom RS232 to TTL Help

The QST circuit works fine - bidirectionally - with both my 735 and 775. Sounds like you've got a bad part, a miswire, or perhaps a defective radio. A scope would allow you to quickly isolate the culprit.

Subject: BA1404 fm-stereo transmitter chip

I am looking for anyone who might have an interest in
BA1404 through hole Stereo Transmitter Chips. I worked for this
company that was contracted to create a FM-stereo transmitter for
oanother company that was using it for commercial use. I helped
design a board and had it FCC approved through Bell Labs.
After ordering 1000 units the company was satisfied yet
their need was fulfilled. I had anticipated 2000 units and ordered
an extra 1000 IC's since the manufacturer back-ordered 5000 for
6 months.
I now have 1000 BA1404 chips to sell if anyone is interested.
I also have 100 crystals and varialbe inductors for the FCC approved
design. If you or anyone you know would be interested please let me
know. I will also give schematics if desired.

dc@interaccess.com
Doug

P.S. I would like to sell them as 1 package but will consider breaking
them up in quantity.

I had a problem with my 51r - the contrast was getting pretty bad, and
some of
the LCD segments were unreadable in the cold. I sent it back to Yaesu,
and
they replaced the display. Now it works just fine, although when it's
dark,
and the backlight is on, it's best when looking straight on.

Good luck w/ you unit.

From: billn9hh@aol.com (BillN9HH)
Subject: ICOM AH-2 Info Please

I don't know if they are identical internally, but functionally, the AH-2
and AH-3 tuners are equivalent. The AH-2 has an external controller that
connects to the rigs computer interface and ALC lines for control while
band changing and tuning up. This interface is used with rigs such as the
IC735. Most newer ICOM (IC737, etc) rigs have the ability to control the
tuner directly thru a four pin molex connector that matches the one on the
AH-2. I'm using an AH-2 with a 737 and it works just fine. When the AH-2
is plugged in, the 737's internal tuner is disabled.

Have not tried it, but think you could go ahead and use the external
controller with these newer rigs, in which case any internal antenna tuner
would still function, giving and even wider matching range.

I don't think extending the control cable a reasonable amount would be a
problem.

From: Bob Ludlum <brlpe@worldnet.att.net>
Subject: Raytheon Raysistors

If I remember correctly from a few years back, the raysistor was a
package containing an incandescent lamp and a photocell (cadmium sulfide

I think). The resistance of the photocell changes in proportion to the
amount of light coming from the lamp so it's an optically
coupled, current controlled variable resistor. It was used in such
applications as remotely controlled gain controls and as the gain
control
element in automatic gain control circuits. If you're interested in
specs
I may still have a data sheet filed away at work (I try hard never to
throw anything away!).

RACES = Radio Amateur Civil Emergency Service = frequencies assigned TO the
Amateur Radio Service. Out of band (the Amateur band, that is) is not
permitted in RACES operation. Besides, it has been posted here many times
before that the RS handhelds are not modifiable for out of band operation. It
might have mad more sense if you had at least said you wanted to operate
either CAP or MARS........

sheeesh....

This has been one of the best non-confrontational discussions I have seen
in a long time. For those of you who could care less about adding to your
obviously limited knowledge I would suggest not even opening up the subject.
After all, it's been running for some time and you know what it's about...
if it doesn't interest you - don't read it for crying out loud.

On 6 May 1996, gary wrote:

Actually I was glad it was here Gary, I was trying to learn something about speakers and music reproduction.

I have very little exposure to dynamic range in music, being a fan of bands like Nine-Inch-Nails and Ozzy Ozborne.

Sometimes the threads do turn into a "gotcha thread". But sorting past all the razzel-dazzel and snow-making machinery there is often something useful to be learned.

I appreciated Jack's skills with audio systems, his comments were easy to read and understand. Besides, if you don't like it, hit delete. Or shoot your monitor.. :-)

If what you need is the same cable that's used for the amateur HT's,
then you need a serial-to-TTL converter. It converts RS-232 serial
data to TTL (0 volts & 5 volts) and vice-versa.

We sell those cables already assembled and tested. For more info,
try "http://www.acsys.com" or email "sales@acsys.com".

What dual-band handheld is the best value out there? I noticed that the new standard for handhelds seems to be a dual-band, but what features are really necessary? What is CTCSS for example and what is a spectrascope? Is a 2m/44oMhz. the best dual - band to get? What brand is most reliable (Kenwood, Yaesu, Icom, Alinco)? What is the general price range? Are the battery packs easily available? What handheld would you get? -Is generally what I am asking anyone. Thanks in advance {to any brave soul whom wishes to answer this question.} Turner Gutmann [A soon to become Technician]

1960. WTB: Med./Heavy Duty Rotator

Hi everybody,

First of all thank you for taking time to read my message. My name is Jason and I live on the Island of Malta, in the middle of the Mediterranian Sea. I would be looking for a Meduim or Heavy Duty Rotator, to use with my VHF antennas. I shall be putting up 2 Cushcraft 18 Element Yagis (2M) stacked on top of each other as well as a 4 element beam for 6M and finally a 23 element for 70cm.

I also would like to hear from anybody who has any linears or preamps for the above bands.

Whilst hoping to hear from you soon, I thank you in advance.

73's for now

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-06 00:00:00 UTC
From: jon cave <75051.2142@CompuServe.COM>
Message-ID: <4mjtr6$a65$1@mhafn.production.compuserve.com>
Source record: 201633

I have a Icom 2410 also. The low transmit audiio is not casued by the deviation in the radio. Icom designed the microphone with too much filtering. If you remove the diode that is soldered across the two pins of the microphone element your transmit audio will be much better.

One mod I found recommended replacing the microphone element with a certain one (can't remember the #) from radio shack. I did that and my transmit audio is now very hot. I need to readjust my deviation buy I haven't. I have to hold the microphone about a foot away from mouth to keep it from over deviating on VHF. No problem on UHF though. I think Icom recommends just removing the diode. Give them a call or visit there forum on compuserve under hamnet and they can help you out.

Come on Clint the HTX-202 low deviation problem is long standing and well known. I know you think the Tandy stuff is great but they have some serious QA problems and most of all at the retail level they just don't have a clue. The problem stems from the deviation adjustment telling the guy to speak into the mike is a cheap shot.

To the original poster there is a deviation adjusrment I can't remember just which pot it is but I am sure someone here can help you. Don't mind Clint he just has a lot of Radio Shack stock.

Hello,

I read a reviev of the DSP II by W9GR. It seems to be an interesting candidate for narrow band CW filtering. Does someone here have experience with it? Where can it be bought? (HRO apparently do not sell it.)

73, Moritz DL5UH

The dealer I bought my 2410 from gave me an HM-14 mic. It lacked the
autodial memories, but A/B comparisons showed it provided more mic
gain, and better fidelity.

Sir,

It's still available. The IBM/DOS Broadcasting Radio Station Database Program for Longwave, Mediumwave, and Shortwave. Over 4,000 records included already. The program is completely read and write. Records can be added or changed. Sorts in many different formats both on your screen and printing.

If you would like a copy of the program, send your request to "chuck@flinet.com". Please include your MAILING ADDRESS - SNAIL MAIL. For example, your street number, city, state and zipcode. Also include your EMAIL address.

The program will be sent to you via EMail probably within 24 hour is not sooner. If you reqeust the program and havenn't received it in that period, check back with me. Sometimes things get lost on the internet.

Remember to send your address. Requests without a mailing address will not be acknowledge to save time on the internet. In the past requests without an address were reminded with a message. Usually, the reminder went unanswered anyway. If it wasn't, the reply was sometimes very rude.

This program is FREE! Everything works. It has many features and they all work, not like shareware where some of the features work and other don't.

Your Postal address and EMail address will be kept CONFIDENTIAL. I may in the future contact you via Snail mail with a description about the Voyageur Database program. That's it.

Hope to hear from you and best regards.

75162.2371@CompuServe.COM says...
>
>Huh? The images are 90.2MHz HIGHER than the fundamentals, so you'd hear
>full strength signals in the 959-984MHz area.

How do you know they are higher? They could be higher or lower, depending on which side of the receive frequency the LO is. With my rf generator set to 881.5, I can set the radio to either 791.3 or 971.7 and receive the signal. I can see the LO in both cases on the spectrum analyzer at 836.4 and 926.6, respectively. So, apparently the receive range of the radio is extended simply by flipping from high to low side injection. By the way, the sensitivity is about the same in both cases...

I'll delete most or all of the unnecessary personal snipes and opinons and try to stay with generally useful facts.

In article <1996May3.222151.20156@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us (Gary Coffman) writes:

>>All of that aside, where is the big "tetrode distortion advantage" you
>>touted while being so openly critical of my technical analysis and
>>ability? It certainly doesn't appear in those numbers!
>
>The numbers are better than the original amplifier with 8875s. Now I
>didn't say that the modification was optimum did I? I don't think so.

8875 measured third order (one measured sample of a pair of tubes 1980 data) : -39 dB third, -44 dB fifth at rated output. Your reported data was -38 and -48 dB with negative feedback. Where's the "big universal tetrode advantage"?

To refresh memory of the origninal claim, you said:

"Tetrode amps have better linearity and more power gain than triode amps. They do require a screen supply, and the tuning is a bit different, but that's only marginally important when contrasted to the advantages they offer."

This is a pretty broad general statement that just isn't true in some areas, specifically the claims of "better linearity", "tuning a bit different", and "advantages they offer".

>If someone started with a clean sheet of paper, I'm confident better
>performance numbers could be obtained. As I'm sure you are well aware,
>more than just the number of grids in the active device are involved
>in achieving a clean amplifier.

Which was my point all along, and you now seem to agree with me and disagree with your statement above. My only point is if someone is going to do the all the work, do it correctly. Especially if it's just a matter of adjusting a few component values.

>This modification appears reasonably easy to do, saves a good bit of
>money compared to a new pair of 8875s, and has better measured
performance
>in important areas than the original amplifier. That looks like a good
deal
>to me. If the ARRL lab test results showed worse performance than the
>unmodified amplifier, I'd tend to go along with you in your criticisms.

I don't have critisisms, just facts.. One fact is two tone fixed power level tests are not good tests (in particular with tetrodes), another new one is the ARRL "Lab" doesn't always measure amplifier parameters correctly.

For example, in the past the Lab has measured efficiency incorrectly. The error was caused by subtracting the entire amount of drive power from the output power during efficiency calculations.

The correct procedure is to ADD additional input power caused by the cathode/anode voltage contribution during the cathode's negative voltage excursion to the plate input power calculation, since the positive cathode voltage excursion (subtracting from the effective HV) has no effect when the tube is cut off.

Incorrectly subtracting the driver's power from the output (if still employed) produces artifcially low efficiency calculations....with low gain high conduction angle linear gg triodes paying the stiffest penalty.

>But that's not the case. There may be a different modification one could
>make that would result in even less expense and even better performance,
>but the given modification looks like an improvement to me.

I'm concerned, as I've said over and over again, about throttling back exciters so far. The designs require increased exciter IMD and ALC (power control) overshoot, and that system almost always works poorly at full power. Getting the amplifier running is an improvement, but that wasn't my point. My point was why not simply put the correct resistor values in the circuit? What is wrong with that no matter HOW it works?

>I've been critical of your technical analysis because you haven't
>even read the article or looked at the ARRL lab report. If you had,
>you'd have noticed that the cathode resistor is not bypassed, and
>you'd have made sense out of my attempt to describe what the graphs
>show.

Critical I don't mind, but nasty and accustory without fact while avoiding technical issues...I do mind. No one learns anything from personal remarks. It's boring, uniformative, and paints the attacker as a "real jerk" covering his technical inabilities or errors by unwarranted attacks. Personal opinions have no place in technical discussions.

My comment was QST must have slipped up, and I hope it isn't becoming a trend. It is unusual for them to allow an author to slide in derogatory comments about a competitor while extolling virtues of his own product. This is especially true when the virtues are at **best** very "overrated or exaggerated" for the application.

> I get the distinct impression
>that you've assumed the designer of this modification must be stupid.
>How about assuming instead that he was reasonably astute? (You can
>feel free to accuse me of being stupid for attempting to describe the
>article to you.)
>I've also been critical of you because you seemed to have a kneejerk

>reaction to the mention of Svetlana in this article and the original
>one.

I can assure you I'd be just as hard on Eimac, Collins, RCA, or myself if incorrect data was released to the public. I don't care who the source was, no one has the right to falsely demean a competitor (especially in a historical or technical article), or give readers incorrect data. That was totally out of place in an otherwise good article.

What ever happened to personal ethics and pride?

> Now I don't know why that is, but I find it difficult to believe
>that it is merely a matter of a technical difference of opinion about
>the relative merits of triodes versus tetrodes. Why do you think they
>bother to put that extra grid in there if it doesn't offer some
>advantage?

The tube was originally designed for the Russian Millitary where high power gain was required, not for low IMD or consumer applications. Now that Soviet war machine has fallen apart, the tubes are freely available. They do make 3CX3000's and other triodes, but nothing in the amateur power level range of 500 to 2000 watt dissipation.

>Why do you think designers at Harris, RCA, Gates, Collins,
>etc bothered to use tetrodes if they are inferior performers?

Because of the application Gary. Tetrodes are the "wrong tube" for use with 100 watt SSB exciters. Tetrodes are correct for high power gain commercial amplifiers. This is engineering common sense, good engineers avoid using complicated and difficult to operate designs unless absolutely necessary.

>Is it because they just liked to design screen supplies?

No, it's because the design tetrode application was almost always fixed-tuned high-gain amplifiers, rather that hobby type "change-frequency-every-ten-minutes amplifiers" used with 100 watt (or more) exciters. We should all thank Eimac for pushing to develop so many zero bias triodes for our market, not paint them as a group that "was not driven by technical performance" and "driven by simplicity, low cost, and superb product promotion".

That comment is absolute rubbish, and the author and QST should be ashamed for allowing it in as well as highlighting those worded in a boxed large print area.

There are only two **clear** advantages of the Sveltlana tetrode over any other comparable triode in HF amateur applications. The advantages are tube cost and ease of gain modification by changing component values. What's wrong with telling the truth and setting the values correctly?

Hi-mu G-G triode advantages: Gain compatibility, ease of operation, simple and easy to design circuitry, very little change in performance with circuit parameter changes, inherent negative feedback, linearity and IMD

generally better than state of the art for the exciters used, and lower supporting system cost.

Disadvantages: Fixed gain limited by tube and circuit parameters, tube cost (with current sources).

Grid driven tetrode advantages: Tube cost (with current sources), gain can be easily adjusted to the proper value with the ***correct*** grid loading resistance.
Disadvantages: Difficult to tune, easy to overdrive (with severe distortion products quickly resulting), more complex circuitry, hard to measure and control grid current accurately in SSB operation, substituting tubes requires major physical and circuit design changes.

>doing this. Thanks for any help.
>
>Paul AA6Z

I can't take credit for this procedure. It was written up in QST some time ago.

Here is how to do it. First, get a new battery. It is available at Radio Shack as P/N CR2325. I have not verified this, but the battery I received from Icom is a Panasonic BR2325. The R/S P/N references to a Ray-O-Vac BR2325. I assume this to be the same as the Panasonic BR2325.

Take the ram unit out of the transceiver (the one with the lithium battery) so you can work on it. Trace the battery + and - leads to the nearest I.C. legs so you have a point of attachment. You need four clip leads like Radio Shack sells. The type that have a little spring-loaded hook on the end so they will stay attached to the legs.

Hook the new battery in parallel with the old battery (at the I.C. legs.) Carefully remove the old battery. Helps to use a solder sucker (also available at Radio Shack.) Hook up the old battery in parallel with the new battery so you now have two batteries hanging on clip leads.

Remove the clips from the new battery and solder it in the board. Remove the clips from the old battery and you are done!

Hi John,
First, it's illegal to transmit out of the amateur bands (except CAP and MARS) with a non-type accepted radio, so I'll assume your speaking about the MARS frequencies. Secondly, the Radio Shack units can not be modified for out of band receive, period!

Source record: 201658

Hi,

I'm just getting started and I need to purchase an HT. I've narrowed it down to one of 3 (all Icom), the W31A, Z1A or W2A (obviously used :-). I want a radio that can do wide-band rx. I read that the W31A can easily be mod'ed to do from 50-999, and the W2A already does this -- how about the Z1A? Anyone know why the Z1A is "on sale" for $100 off? According to the description sheets on Icom's homepage, the Z1A and W31A are almost identical. Any information (like where to find information on mod'ing the W31A and Z1A) would be greatly appreciated. The prices I'm getting are ~$290 for the W2A, ~$430 for the W31A and ~$330 (after rebate) for the Z1A.

...thnx,
...dave alden (no call sign yet -- just passed the Tech-Plus test on 5/4/96 :-)

Source record: 201659

After purchasing an Eartalk for my Yaesu FT-530, I am totally disappointed in the quality. The earphone doesn't stay in my ear well, and it is easy to snap apart the PTT button control into its component pieces. I have since returned it.

However, I have purchased the Standard CMP123 EarMic, and I am extremely pleased with it. It works fine on my Standard C508A, and it also works on my Yaesu FT-530 and FT-50 (w/ CT-30 adapter). Note that the Mic Gain switch must be set to high to trigger any of the Yaesu rigs. The earphone fits well, and the audio is great. I've had no complaints from ANY one whose heard my audio, and the only comment I've had is "You sound like you have a bit of a cold."

Also, the Standard unit is $20 cheaper than the Genesys.

> mode link. When you go into KISS, you are no longer doing AX.25 in
> the TNC so the link is lost.

Thankyou for your reply,

What I was trying to do here is to measure the bit error rate of the
radio link.
Unfortunately, bring the TNC to KISS mode and thus removing AX.25 does
not
help because there is yet the HDLC layer embedded in the TNC. Can you
give me
some suggestions ?

What about the modem disconnect ? What is that all about ? Frankly, I am
an
absolute newbie to the radio world...

Thanks

Alex

I wanted to pass along, if you use your 706 mobile with a Larsen 5/8 wave on VHF (2M) and run the high power on 6M (hamstick), with only a couple feet separating them on the roof of a
vehicle you can induce over 20 watts of power into your VHF antenna jack, this promptly smokes D6 filter switching diode. The Larsen 5/8 is close to resonance for 6M and does a fair
job of coupling the 6M power into the 2M antenna jack . I tested a simple 1/4 wave and the pickup was very low, way below half watt. Of course ICOM graciously repaired mine, after that
boneheaded stunt, under warrantee and returned it 2nd Day UPS.

Thought I should pass this along lest anyone else unsuspectedly gets that odor of "cooked diode" permeating the inside of your vehicle

Just a note, I have used these (BA1404) stereo xmtr chips in many projects
and they work great. I am using one in a xmtr now that sends the stereo
signal from a music equipment rack (stereo out from 16 channel mixer)
to a wireless stereo rcvr. I wear on my guitar strap. Works great.
.. low component count too, just my $.02 worth.

Hi,

I am trying to rebuilt my AV-3 which was taken out by hurricane Opal last year. Hope it don't happen again this year!

I need to know the lenght from the base to the first trap, the length in-between the two traps and finally, the top section lenght.

This information would be very helpful.

Thanks!

Is is common to use the HTX-212 as a handheld? How many hands does it
take to carry the rig, the lead-acid battery, an antenna and a mike?

It might just be easier to carry a around Buick as a really handy hold-all.

>As I noted in the part you cut, 152 dba is obviously
>ridiculous,

You didn't say it was ridiculous. You claimed it was the actual
peak SPL that would be required to reproduce the dynamics of
live music in the home.

>which is why you have to restrict the musical span you can
>reproduce to less than the full 90 db offered by a CD.

First, most music does not consume the full 90 dB dynamic range
of the CD. Second, the full dynamic range of most music *can*
be achieved at reasonable power levels with the right system.
Regardless of all this, your numbers are still way out of line.
Even live music doesn't peak at 153 dB SPL (except for maybe the
cannons in the 1812 overture).

>That still leaves you with a range sufficient to require at
>least 13 db of dynamics. And if the average level requires 40
>watts, then the transient would require 800 watts.

I've already shown mathematically why 40 watts isn't necessary
in order to produce an average 80 dB SPL.

>Note well that those are just example numbers, and not
>necessarily representative of a particular system.

This sounds like you're trying to get your calculations off the
hook, but you can't do that and still propose these numbers.
There is no hi-fi speaker system in existence (other than
perhaps plasma drivers) that requires anything remotely close to
40 watts in order to produce an 80 dB average SPL at 2 meters
distance. That would be the equivalent of an efficiency of only
0.006%, which is a gross departure from *all* real-life systems.

>Ok. I don't know what reference you're using for that scale.
>I was using the A weighted scale on my sound level meter which
>is in dba, where 'a' corresponds to a certain audio power level

>at the microphone input stated in something like microbars or
>whatever (the calibration sheet isn't handy).

Unfortunately, I no longer have my texts listing the various weighting systems. I had thought the only difference was the time constant, but I may be wrong. If the sheet supplied with your meter indicates that there's more than this at work, then the meter won't be directly useful for speaker SPL calculations. SPL weighting aside, the two primary acoustic measurements that allow us to determine the system's capabilities most accurately are A) speaker sensitivity measured using a sine wave, and B) the peak SPL of the source, measured with a peak reading instrument.

For reference, all the numbers in the table I presented indicate maximum total *average* SPL for the various sources. That's why it was necessary to describe the average VS peak of the orchestra separately. Actually, I did make an error in that description, but I'll correct it at the end of this post.

Incidentally, I've never seen a chart that showed 100 dB SPL to be the threshod of pain as you stated. That would mean the low-efficiency 90 dB speaker in my example would cause pain at only 10 watts, something I know isn't true.

>Looks like you're using the threshold of hearing as a
>reference, but that's rather dependent on individual hearing.

0 dB is a precise reference that was established on the basis of the approximate threshold of hearing. The intensity level (IL) of 0 dB is 10^-12 watts/sq. meter, also equal to a sound pressure of 0.0002 dyne/sq. centimeter. Whether an individual can actually hear this isn't relevant to our discussion. We only need to know that he can hear levels above the ambient noise, which is nearly always much greater than 0 dB SPL.

>I think your quiet room number is too low, but I'll accept it
>since it makes the dynamic problem worse. Instead of a 40 db
>span as I postulated, we're now faced with reproducing a 80 db
>dynamic span.

You're not visualizing this correctly at all. The limit to the system is determined by the maximum SPL it can produce. The lower the noise floor, the greater the dynamic range capability will be.

>Some sort of logical error must have sneaked in there
>somewhere, above you are postulating it taking 1 acoustic watt
>to deliver 90 db SPL,

Gary, I've deleted much of what follows because it was based on this error. The "dB at 1 watt/1 meter" rating is a standard specification for stipulating loudspeaker sensitivity. It is

used throughout the audio industry. In this case, it means that the speaker I described will produce 90 dB SPL at a distance of 1 meter when driven by 1 watt of electrical power. This doesn't mean the speaker is delivering 1 acoustic watt, nor is 90 dB at 1 meter equal to 1 acoustic watt.

Just for informational purposes, 1 acoustic watt is pretty loud, approximately 112 dB at 1 meter.

At this point, I need to correct the error that I mentioned earlier. To do this, a better description of the sound power contained in the output of the orchestra is required.

The rating of 115 dB SPL is maximum average total pressure at 15'. The 20 dB peak to average ratio of the range of 200-400 Hz that I mentioned earlier is correct, but the maximum average pressure in this range is less than the total maximum average pressure of the entire orchestra. That is to say, total average pressure is the sum of the average pressure in *all* the various bands of frequencies, not just this one. The end result is that the maximum peak SPL (which is greatest at 200-400 Hz) is only about 5 dB greater than the maximum average total pressure. This affects both of my two previous examples.☐

First, consider the example in which the goal was to achieve 80 dB average SPL at 2 meters. We know from the previous calculations that 0.4 watts average power will produce this level. Therefore, rather than requiring 40 watts on peaks as previously calculated, we only need 5 dB more, or 1.3 watts. This should not be confused with the total dynamic range of the orchestra, which is still 80-85 dB.

Now, the original concern was only for a system that would deliver an average level of 80 dB SPL, but it looks like we have a considerable margin to work with at this point. Let's see what can be achieved with a moderate increase in power.

If it's assumed that the volume is adjusted so that musical peaks correspond to 1.3 watt, those peaks will be reproduced at a SPL of 85 dB at 2 meters in this system. Because the ambient room noise is assumed to be 35 dB SPL, this will only create about 50 dB of audible dynamic range. For every 10 dB that we increase the power however, another 10 dB of dynamic range will be gained. In this particular case, we could recover 70 dB of dynamic range with a system capable of producing 130 watts. Peak SPL under these conditions would be approximately 105 dB. This is more than sufficient to provide excellent quality sound at a level well above casual listening.

In my second example, regarding live listening levels, we now have a total maximum average SPL of the orchestra at 115 dB with peaks 5 dB above that, or 120 dB. This is measured at 15' from

the orchestra. The goal is to duplicate this same level at a distance of 2 meters from the speaker.

If we apply these numbers to the Klipschorn as before, more power is required than I previously calculated. This speaker produces approximately 105 dB at 1 watt/1 meter, which is the equivalent of 99 dB SPL at 2 meters. To raise this to 120 dB peak SPL would require a 21 dB increase, or approximately 125 watts peak.

Note that this requirement may be reduced by as much as 3 dB, because we have two speakers, not one. The final power required at each speaker will depend on the spatial location of the source of peak SPL. If the signal source is monophonic, two of these speakers could provide live peak listening levels with an amplifier capable of as little as 62.5 watts per channel.

Gary, with that out of the way, I want to go back to something you said previously regarding early speakers like the Altec Voice of the Theatre. In the 50's and early 60's there were many types of speakers on the market. Some of them were (and still are) the only speakers capable of producing live listening levels with any reasonable amount of input power.

An examination of the better designs, which includes bass horns, reveals that they share a common characteristic that caused their demise. Namely, they were designed for the music of that era. Those speakers worked just fine for the spectral diversity of an orchestra, but many of them had a lower cutoff of 100 Hz or higher, totally unsuited for rock or pop music. This was a necessary tradeoff in order to produce high efficiency speakers in a reasonably sized cabinet, but it was also this shortcoming that first brought the acoustic suspension speaker to the forefront. Once that occurred, the need for larger amplifiers followed quickly, because the newer acoustic suspension speakers were much less efficient than their predecessors. This trend continued and it eventually created a market in the 70's for amplifiers like the Phase Linear 700B, Crown DC 300A, Bose 1201, Dynaco 400 and many others designed to bring home hi-fi back to lifelike levels.

Klipschorn, on the other hand, represents the only speaker produced in the earlier era that exhibits both high efficiency and a frequency response suitable for rock music. It uses a folded (patented) exponential woofer horn capable of producing flat response down to approximately 32 Hz. It's an ingenious design that not only makes full use of a rectangular cabinet, but acoustically couples into the listening area in a way that causes the corner of the room to actually become the mouth of the horn. Aside from a few inferior takeoffs (most from companies later sued by Klipsch), there has never been another speaker of this type. The bass output is absolutely thunderous

and the available SPL can make a grown man cry.

I'm only mentioning this because of your earlier statement that horn-type speakers fell away due to audible phase shift within the drivers. Klipschorn is the only horn speaker ever sold to consumers that had a bass horn sufficient to provide extended low frequency response, and I don't think it's a coincidence that it's the only one of the lot that survived.

I also don't think it's reasonable for this type of speaker to be overlooked on the basis of phase shift, much concern for which is fostered by manufacturers that hold no patents and can't produce quality horns. The Klipschorn continues to be one of the finest speakers ever built, and its combination of high efficiency and excellent THD and IMD characteristics have yet to be equaled.

I've been into CB (no flames, please!) for a long time, esp. because
I'm a professional driver. But I've had an interest for some time in
Ham. I'd like to find a *decent* but not *too* expensive all-band HF
that will also do 11 meters. Thought I might like a Kenwood, assuming
it could be mod. for 11M, but there seems to be a great deal of
dissatisfaction with them expressed in this NG.
I need a fairly *small* unit that can be used mobile, and will be
taken in and out of the truck very often. IOW, it HAS to be durable!

So.... any recommendations for a heavy-duty, yet small, all-bander,
easily modifiable for 11M, that doesn't cost a small fortune?
And, BTW, any antenna rec's as well would be appreciated.... keeping
in mind that I'm basically going to have to use ONLY ONE (maybe 2, if
I can figure how to mount them).

All help appreciated..... Cheers!

Source record: 201496

Restoring an old SWAN 700CX/SS16 rig and while the finals seem to be in satisfactory condition, finding these old rascals may be somewhat problematic. Would like to find data that speaks to the interelectrode capacity between the tube's various elements. Transconductance would also be interesting. The ARRL handbook lists a few hefty sweep tubes with dissapation in the nnear 40 watt range with a pin out close enough to the 8950s that a direct plug-in swap would be possible, but the replacement tube (6MH6 I believe) has fairly high interelectrode capacity (about 40pf grid to cathod) and a fairly high output capacity as well--Will probly function on the lower bands, but on 15 and 10 meters the tank may require some retapping of the inductor to restore the tank to resonance. Any help would be appreciated.

>connection? Don't want to mess it up.....Thanks....Ray - KE4UYN

I have an AL 811 hooked up to my TS850. Basically, in addition to the
coax connections, there are two other connections: the keying relay connection
and the ALC. These are standard RCA connections in the back of the AL811.
On my 850, the output for these functions was a DIN connector. Therefore,
I had to fabricate a cable that had the DIN connector at one end, and two
RCA male plugs on the other.

The keying relay cable keys the amp, and is essential. The ALC plug enables
the amp to tell your transceiver to limit its output into the amp to a maximum,
thereby preventing overdrive of the amp. This connection is not essential,
but is a nice feature.

I am also using the QSK-5. If you have any questions about the amp
or the QSK 5, let me know.

>a certain amount of RF power?

I'm using the QSK-5 with my TS850 and AL811 amp. I use it primarily
for Amtor and Pactor, both of which require fairly good QSK.

As far as the Aux antenna question goes; I don't understand your question.
It is simply a switch; it keys between the transmit function and the
receive function in your transceiver, using whatever antenna the transceiver
is using.

Since it is switching a considerable amount of RF, apparently some of this
energy does create heat. I use the aux fan adaptor since I'm using high-duty
cycle modes.

I hate to do it, but I've finally decided to part with my Yaesu FT-990
HF transceiver. The radio is in absolutely like new condition. It is
about 2 1/2 years old and has received little use over the last year and
a half. Of course, I have the original packaging and documentation.
I'm asking $1775 - I ship.

If you're interested or want more information, please email or phone.

>gain, and better fidelity.

I asked my question over on Compuserve and the ICOM Tech Support rep said the "standard fix" for this problem is to remove the zener diode across the microphone element. I will give this a try and see what happens. Thanks to all here for their responses.

<wn878@freenet.victoria.bc.ca> says:
>Remember, this was a hamfest held in a major metro area! This all
>makes me wonder what the really big hamfest (Dayton) was like?
>Is Kansas City just a sucky place for a hamfest, or is the hobby of ham
>radio slowly slipping away?

i've been to several hamfests in the Phoenix area, and i was wondering
the same thing. if i'm real lucky, i might find a couple of air variables.
i haven't seen much in the way of working radios. this is in an area
where there is a very active weekly swapnet, so i have to assume that
hamfests just aren't cutting it anymore.

then there was the Butte, MT fest. five bucks admission, and almost
nothing inside.

From: sbryant@wco.com
Message-ID: <4mnt61$861@news.wco.com>
Source record: 201505

Hello-

I have ICOM IC-730 that appears to be having a problem. When I press the PreAmp, the volume actually gets softer instead of louder. Has anyone else experienced this problem? If so, what was the fix and is it somethings that could be done without sending the rig to ICOM for repair?

Any information will be greatly appreciated.

From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <4mnvle$4a5@pacific.mps.ohio-state.edu>
Source record: 201507

In what was possibly my most extreme act of silly impulse buying, I shelled out $500 for an AT-180 tuner for my Icom 706. I used it last night and was very disappointed. For example, on an 80meter inverted vee which is resonant at about 3700KHz, it wouldn't produce an acceptable match at 4000KHz. It wouldn't match the 80 meter antenna on 40 meters. I'd be interested if there are any other folks out there who have tried this tuner, and what their impressions are.

Message-ID: <4mo2a3$g0a@pulp.ucs.ualberta.ca>
Source record: 201509

Hello,
Just spent the weekend cleaning up an old Halli S108. I know that this one is not the cream of the crop, but it works fine. It has a small crack on the glass, and is missing one knob. It is also missing the dial lamp for the main tuning window. Does anyone know what the replacement is for this one? Also, I have a Heathkit HRA-10-1 100KC Xtal calibrator that goes with the radio. It doesn't have its tube, and I am wondering what tube it requires. Lastly, the internal speaker is missing, and I am curious about the impedance for a replacement.
Thanks for any assistance,
Chris VE6RDC

jackl@pinetree.microserve.com (WB3U) writes:

>
>At this point, I need to correct the error that I mentioned
>earlier. To do this, a better description of the sound power
>contained in the output of the orchestra is required.
>
>

I hope you don't mind my butting back in, but the subject of correcting
errors brings something else to mind.

In an earlier post Gary said:

>One is the performance of the amplifier in clipping, and the other is
performance
>of the amplifier before it reaches clipping, IE ordinary distortion
>due to a nonlinear transfer characteristic. The latter is always
>undesirable, while the former is inevitable when an amplifier is
>heavily overdriven, and can only be ameloriated by good circuit design,
>IE the higher order odd harmonics can be attenuated by suitable output
>filtering. The output transformer can serve that purpose for most
>tube amplifiers.

I notice that while Jack freely corrects and supports his statements, Gary
remains silent about the comments he made above. This puzzles me, because
while new data is freely presented some old very questionable statements
at the heart of the original discussion remain ignored.

Gary, my questions were and are:

1.) If the harmonics (or any distortion product) are within the range of
hearing, how can a transformer attenuate them without attenuating desired
signals also?
.
2.) What technical facts support your statements related to why a
practical amplifier, when it "clips" or distorts, only generates odd
harmonics?

I assume you didn't read or receive the earlier questions, or forgot to
reply.

Source record: 201513

Thank you for reading this...

I hope you can maybe help me. I have a Kenwood TS120S. I have a problem on it which no one can help me with. Not even the agents as the previous owner did take it there.

Everything works 100%. Rx and TX is 100% except for one thing. When the TX is keyed in ssb mode without modulation it draws a current of about 15A.There is however no power output(while not modulating). When another RX is put closeby and you key the TX a tone is generated on the RX about 2khz of frequency. If you however modulate(talk) on the rig there is no problem with the ssb output and good signal reports is received except of course that the current drawn stays 15A. The ALC meter also function OK and only goes up on modulation like it should. I have however found that CW output is only about 50W but I do not think its related to this problem. Could you please assist me by telling me where to look to see why the rig draw such a lot of current when its not being modulated. RX current is normal. The rig is usable as it is but I don't think my PS30 power supply will last.

The rig does the same in a dummy load.

Your assistence will be greatly appreciated.

Hi,
I saw a number of them going for about $250ish at the Mike and Key Club's
Hamfest although they were not selling real fast. I just picked up one
that had just had new finals installed for just under $200.00 from a
friend a few monthes ago and think that was a reasonable price. I am
real happy with the one I have.

You might want to check on the Swapnet I think it is on Saturday or
Sunday morning and starts around 8:00 - 9:00 AM on 145.330.

Have fun
Tom

Tony, I have the MFJ 259 and love it. MFJ has finally made a great
instrument. I can check any antenna for between 1.7 and 170MHZ and
know if that 2 to 1 is 100 ohms or 25 ohms. You can adapt the unit to
a GDO and use the digital freq counter for aligning a receiver.

Either unit could be overloaded by a nearby BC station.

I don't use my GDO or noise bridges any more!

2045. CAN YOU IDENTIFY THIS MICROPHONE? << HELP >>

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-07 00:00:00 UTC
From: Bill <debral@falcon.cc.ukans.edu>
Message-ID: <1996May7.191856.119401@kuhub.cc.ukans.edu>
Source record: 201532

I have an old Turner microphone that I hope one of you out there can help
me identify.

Here is the description:

MANUFACTURER: Turner

TYPE: Desk mic (push-to-talk)

VINTAGE: Late 1950s to early 1960s (best guess)

DESCRIPTION: The microphone is satin chrome plated, with
a black plastic "push-to-talk" bar located
in the base (at the front). Overall height
is approx 8 inches.

The Turner logo is in red and chrome, and is
located in the center of a shiny chrome,
perforated screen.

When placed on a level table, the vertical portion
of the stand slants AWAY from the user at
about a 10 degree angle.

The overall appearance of this mic is VERY
streamlined.

It is all one piece (as opposed to, say, an
Astatic D-104 that has a very distinct
transition from the removable crystal element
to the UG-8 stand).

On top of the mic element housing is a small "fin"
that gives this mic a very 1950s look.

This appears to be a DYNAMIC type microphone. Removal of
the mic element reveals a small impedance (Z) matching
transformer.

ADDITIONAL INFO: There is a picture of this mic on page 9 of the
ARRL publication "Understanding Amateur Radio" by
George Grammer (first edition, 1963).

Please e-mail if you have an ID on this one, or if you need any additional
information.

>

He's right...speaking into the mike makes a big difference...the thing is
fairly dirrectional. However the deviation adjustment is pot R101 I believe.
It is located upper right about 1" down and 1" in on the circuit board.
Carefull...this pot is sensitive and it's as easy to get too much deviation as
not enough. Fixed the 'speak up...can't hear ya' reports on mine.

Date: 1996-05-07 00:00:00 UTC
From: redge@intranet.on.ca
Message-ID: <4mocr0$f6b@news.bellglobal.com>
Source record: 201539

I've decided to take a shot at learning Morse Code with the intention of applying for a license in a couple of months. I don't know much about Morse Code or radio, except that I use an SSB marine radio sometimes. I did read an article that said that Morse should be learned at a rapid character rate, which makes sense. I have a software program that purports to teach Morse called NuMorse. Is this program good or is there something better? Should I get a keyer and oscillator? What kind of keyer? What make? Any advice would be appreciated. Thanks.

I had one and worked 200 countries. It was my first real HF antenna
and I had no problems, even using an amp. Also, the neighbors did not
complain about it as I took down a TV antenna and put up the Butternut.
When I took town the Butternut and put up a Cushcraft A3S they went
nuts!

Good luck!

Yeah for Expanded Receive you wanna take off the front panel, and open up the
front panel, inside you should locate two wires, cut the red wire for
extended RX. If you want extended TX cut the blue one as well. either way,
put the radio back together after finished and reset.

I just completed construction of the 6M transverter kit. This is not a beginners kit for sure. Most of the kit is very straight forward, however, you do have to wind 4 air chokes and two toroidal transformers. Those items are what keep this kit from being a good one to start off with. If you are an experienced builder, go for it.

2070. Stopping scan on Alinco DR-130T

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-08 00:00:00 UTC
From: dx@tir.com
Message-ID: <319088f0.3476498@news.tir.com>
Source record: 201557

I have an Alinco DR-130T VHF rig with the 100 memory option board installed. As it comes from the factory when scanning memories the rig will stop on a busy channel then resume scanning after about 5 or 6 seconds whether the channel is still busy or not. This is very irritating when listening to police calls. Does anyone know if the rig can be modified to stop scanning on a busy channel and stay on the channel until the carrier drops then resume scanning ? I can find nothing in the manual about this anywhere. Any help appreciated.

Generally it is the preamp relay that is the problem. You will need to
change it out. The 2SK125 FETs are not normally the problem.

Gary

2072. Kenwood TK-250 Programming Cable

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-08 00:00:00 UTC
From: "David P. Baker" <dpbaker@lilly.com>
Message-ID: <01bb3cf1.1650ce80$1d071c28@bake.d51.lilly.com>
Source record: 201559

Does anyone know if there is a third party for programming software
and programming cables for the Kenwood TK-250 commercial radio?

Thanks,

Dave - AA9OQ

2073. Icom W31A mods?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-08 00:00:00 UTC
From: alden@math.ohio-state.edu
Message-ID: <4mq9ff$hqb@math.mps.ohio-state.edu>
Source record: 201560

Hi,

I've ordered an Icom W31A (found it for $380). I've poked around
on all of the archive sites I could find, and none of them had any
mods for the W31A -- if anyone has any mods for it, please post them
or email them to me (I've received a couple of mods for the Z1A, but
no one knows for sure if the mods will work on the W31A).

...thnx,
...dave alden

2074. Re: Out of Band Modifications for Radio Shack HTX-212

>jscheiwe@tima.com
Press & hold down the "F" & "DTMF" keys on the front panel as you
power up the rig. This allows transmit from 143.000-149.000 in either
vfo or memory modes, and receive as follows:
vfo mode = 136.000-174.000
Mem mode = 143.000-149.000

Live Life Lovingly!

If you wish to order the mods please send $5 (check or money order) for each radio model (1 radio= $5, 2 radio's = $10, etc.) to:

Jamie Bucher
P.O. Box 15653
Loves Park, IL 61132

Please specify if you want your mods faxed, e-mailed, or sent via the postal service when ordering. It is possible that when we send this information additional mods for that radio will be available, if so we will send them along also.

Please included an e-mail address if I have any questions about your order.

2076. Radio Shack HTX 202 antenna connection

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-08 00:00:00 UTC
From: hcohen@analogic.com
Message-ID: <587cc$b2826.196@News>
Source record: 201563

I've had a 202 for about a year now, and have been very happy with it when it works. I think the electronics are wonderful. The problem that I have with it is the mechanical connection of the antenna's bnc connector with the case. It uses a very thin screwed ring with two notches in it. This loosens frequently and causes intermittant contact with the inner electronics. This seems to cause two problems other than just being annoying. It breaks a soldered connection with the electronics and it causes some overload conditions on the transmitter, that causes it to die and require service. These problems have already put my ht in the shop three times. I'm so happy I bought the extended waranty. My questions are the following:

Has anyone found a way of solving this problem?

Has anyone found a decent tool for tightening this ring, other than a small screwdriver?

Thank you.

Howard, n1vxs

Thanks for the information I consider that most folks who have a license know which end of the mike is up so to speak. The low deviation problem is quite common with the RS HTX-202 and I'll bet it was the problem in this case. Occasionally I have to take issue with Clint's RS worship for the most part they sell crap the ham stuff is a little better but old technology and WAY over priced when not on sale.

Interestingly I got a piece of hate mail from a very new ham (5 days) telling me I must not be a ham because of my first post to this subject was so terrible. Can't quite figure that one out but I can hardly wait till he gets a wiff of the code or LAMDA wars.

>
>Does it have a seperate receiver output which goes to the aux
>receiving antenna on the transceiver?

Not as shipped but one can easily be added. It has two "fuse lamps" that protect the exciter in case of component failure. The lead going to the .01 uF coupling cap and the input diode can be removed and routed through a cap to the receiver input. I'd add a pair of parallel nose to back diodes from the receiver input to ground for extra safety.

>Why would it get hot and require fan for higher power?

I use one without problem at 2200 watts plus into all types of loads without any additional cooling or even the internal fan (it's on a test bench), but it's recommended you do use one for RTTY.

>Does it consume
>a certain amount of RF power?

Less than .2 dB by measurement on TX, a bit more on receive due to the series resistance of the fuse lamps. But like any form of protection the loss there is well worth the advantage if you want to have safe RX.

I think it fell apart when Yaesu discontinued the FT101 series. I used to belong to the FT club; in fact, I still have the club stamp with the two tangoing foxes. I wrote to the FT filter address in Florida several years ago and stamped my letter with the FT logo - the answerer said he hadn't seen it in a long while.

> owned a FT-101EE and it was a very good radio, except for the mechnical
> relay that kicked in/out for TX/RX. Having headphones on, I would hear a
> very loud pop!

The FT101 had many faithful followers - a newsletter full of modifications for the FT101 series...including one that fixed the pop you speak of. You could also buy a comprehensive detailed factory service manual for the 101 for something like $25. A very popular transceiver, indeed!

I had the predecessor to the FT101 called the FTDX-100, but it was not imported into the USA because of patent litigation problems with SBE and the SB33/34 line of mobile semi-solidstate transceivers. The FTDX-100 was about the same size as the FT101, but that's where the similarity ended. Entirely different circuitry, single PC board, a nightmare to work on.

I sold my FT-101EE to a guy that was interested in ham radio - however, I have the sneaky feeling it's somewhere on 11 meters. The big tipoff was when the guy showed me his 100W 'kicker' amplifier in his trunk. Oh, well.

Hello: I am planning on purchasing a new transeiver at Dayton. I have narrowed the search (looking at the literature) to the IC-775, the FT-1000MP, and the OMNI VI. My max is $3000.
I have no way to do a true side by side comparison, so I thought maybe some people here could give their guidance with some subjective opinions. I am particularly interested in good receive capabilities. Please feel free to mention any other rigs which you feel may be better, in order to thoroughly confuse me.
Thank you for any help you can give.

I think you'd be better off if you spent a little more money and bought something solid state like the Kenwood TS-130S. I've seen them as cheap as $350; they're all solid state, WARC bands, 100W, CW-SSB (no AM) and virtually trouble free. However, they will require an antenna tuner if 'looking' into anything other than 50 ohms, and require 12 volts DC at about 25A.

This is true. The HTX-212 has out-of-band receive in out-of-the-box, brand-spanking-new, unmodified condition, so it's not really necessary, is it? However, John was asking about *transmit* not receive. The modifications for out-of-band transmit are in the HTX-212's manual - it's a software mod.

A clean FT-101EE or FT-101E still sells for at least $300, and if
it's really clean, $350-375 isn't out of line.

On the other hand, I've seen quite a few of these at hamfests for
$250-300 that probably weren't even worth $150.

Just a quick technical correction of a few comments you've made Gary.

In article <1996May5.163121.28590@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us
(Gary Coffman) writes:

>I obviously don't know the value of stray capacitance between cathode
>and ground in this modified amp (nothing is said about it in the
>article), but there's no deliberate capacitance there. And given
>that T=R*C, and R is fixed at 30 (or 20) ohms, the value of stray
>C would have to be substantial to have any effect at syllabic rates.

The cathode bypass time constant doesn't have to be significant at
syllabic rates Gary, it only needs be significant at RF rates to be a
burden on IMD performance. You've also ignored the impedance of the
charging source, and incorrectly assumed the allowable voltage shift
relates directly to the voltage change used to quantify time constant.

>>For example, consider a class AB amplifier at the edge of cutoff. Adding
a
>>few volts of positive cathode voltage not only reduces the effective
>>current by increasing the bias voltage, it also reduces the effective
>>screen voltage. Moving the screen to cathode voltage around carelessly
at
>>an audio rate is absolutely the last thing that should be done in a SSB
>>amplifier.
>
>Yes, but moving it around on purpose may be useful. Consider that
>screen voltage controls stage gain in a tetrode. By varying screen
>voltage in step with drive, you get a gain control effect in accordance
>with the 3/2 power rule, IE speech compression for "free" without the
>use of external ALC. The author claims that no external ALC is required.

Your claim incorrectly implies RF speech processing at RF frequencies
without distortion by some strange "happenstance" or "coincidence". It
relies on a new load line "happening to be correct and linear" as
effective screen voltage is reduced and grid bias increased from excessive
drive.

The parameters "reducing gain" in your example also move the tube towards
non-linear operation.

>There's a 0.1 uf cap in parallel with a 180k resistor shown connected
>right at the screen. That has a time constant of 0.018 second which would

>seem to smooth response above the syllabic rate, IE above 95 Hz.

You've miscalculated the time constant of the screen bypass by totally ignoring the effects of the screen and supply impedance. The 180k is an insignificant part of the equation. It is the time varying load impedance of the screen that must be swamped out, and any poor dynamic voltage regulation in the screen supply that must be removed. In this case you've ignored the impedance of both the charging source and discharging load.

Once again, time constant doesn't directly apply. The problem demands careful consideration of the *amount* of voltage sag that can be tolerated at dynamically changing load rates. Using only the time constant, as you have done, allows much more voltage shift than good designs generally require.

>OTOH, the author of the article quotes the Swetlana data sheet for their
>4CX800A as yielding a 3 db *improvement* in 5th order IMD with the addition
>of the cathode resistor. I just went back and examined the ARRL lab report
>graphs again. In what I hope is proper terminology, here's what I see.
>
>3rd order -41 db
>5th order -38 db
>7th order -55 db

>All figures are db down from one tone of the two tone test signal, and
>are interpolations from the graph. They might be off a db one way or
>the other due to my interpolation.

This data confirms this particular tetrode has poorer IMD performance than a grounded grid 8875 would produce. As I said earlier:
"8875 measured third order (one measured sample of a pair of tubes 1980 data) : -39 dB third, -44 dB fifth at rated output. Your reported data was -38 and -48 dB with negative feedback. Where's the "big universal tetrode advantage"?"

Now your data suddenly becomes even less supportive of your (and the author of the 811 article's) claims, with the tetrode 6 dB poorer than the triode in a laboratory test.

>Again you're assuming the author of the article is stupid. Assume
>instead that my attempt at explaining the article to you is what's
>stupid.

Stupid is a harsh and juvenile word. Please stop attributing words expressing your views to me. Quote me directly, but don't credit nasty words from your mind to me.

All I've EVER said is the grid resistor was poorly selected, the claims of tetrode superiority are incorrect, and the bashing of Eimac was in poor taste and totally unwarranted.

>Now if the author indeed knows what he's doing (he is a Phd
>with extensive tetrode experience according to the bio), the use of
>a cathode resistor is *not* to cover up an error. In fact, in the

>text he stresses the reasons he chose to use a cathode resistor
>in the circuit, primarily to obviate the need for ALC and to use
>negative feedback to improve amplifier linearity. The hopefully
>correct two tone test data I've entered above would tend to confirm
>his choice wouldn't you say?

No, I wouldn't. While the resistor may or may not help IMD, I am more concerned by the low drive power required. It will likely cause the exciter to trash up, and makes the user depend on the radios internal power control circuitry. That circuitry has poor dynamic response in virtually every rig on the market today.

Secondly, a cathode resistor absolutely will not prevent overdrive or substitue for ALC circuitry.

A two tone test proves little with tetrodes in this application. Anyone experienced with modern solid state exciters and the ALC and power systems employed (and who has witnessed IMD measurements made on PA's tuned without aid of distrotion measurement devices) would realize a steady state two tone test under lab conditions is almost meaningless, and any PA that drives with less than the full output of the exciter is subject to consistant leading edge power overshoots from the exciter.

How bad do is the overshoot? My ICOM 706 peaks at 120 watts (on 40 meters) when the output power control is adjusted to 20 watts!

The author of the 811 article made the statement "tetrode tubes were superior performers" in amateur HF applications, and he also directly reported Eimac high-mu triodes tubes were not designed for good "technical performance". You have repeated that very comment, and have attempted to support it with consistantly incorrect theoretical examples and circuit analysis.

>>The problem stems from the deviation adjustment
>>telling the guy to speak into the mike is a cheap shot.

Excuse the heck out of me. I just experienced an Amateur with the exact same problem as described. When he was advised that the mike was on the bottom right of the face of the speaker/mike, his audio improved tremendously.

No "slight" to the original poster was intended. I only report what I have experienced first-hand or what I have garnered from reliable sources.

Here's a "low audio/external mike" text I found:

The following information regarding low audio with the HTX-202 was found at:

http://pages.prodigy.com/CA/LA/htx202htx404/htx202htx404.html

Title : Low ext mic audio on the HTX-202 and HTX-404

If you own the HTX radio you probably already know about the low external audio problem. I have tried a few different brand mic's and they all failed to get any significant audio into the radio. There is a good reason for this. The problem is the radio does not provide enough voltage to properly bias an ext condenser mic. When the radio is keyed the voltage at the ext condenser mic drops to about 2 tenths of a volt. Most common condenser mic's need a minimum of 2 volts and a nominal of about 4.5 volts. Design flaw or design feature. You be the judge. There is an easy way to get around this. I will tell you how to modify the Radio Shack speaker mic to get very respectable audio out of it. You then will be able to amaze all the smug Yaesu and Icom owners that have looked down at your HTX rig.

You will need the following parts from your friendly neighborhood Radio Shack

cat num,..... description,..... generic

19-310..... speaker mic

270-430..... lithium batt holder.... 20 mm single cell

23-162..... lithium battery..... dl2032..3v 180mah

270-092..... condenser mic..... -65 db sens 2v-10v

.33 microfarad cap,disc type or any small profile type cap

At this point I should say that this is a " use at your own risk"
modification. It is not approved by the manufacturer and if they knew
it would probably void your warranty. Any damage to your radio because
of an incorrectly implemented mod to the speaker mike is solely your
responsibility.

Now having said that, probably the only thing to happen if you blow
the mic mod is that the mic won't work or you won't be able to key the
radio from the external ptt switch. They made the radio hard to hurt
through the ext mike jack.

#1: Unsolder the ptt switch.

#2: Cut the leads to the mic element and remove original mic.

#3: Connect the red wire from the main cable that was going to the
ptt switch before to the side of the resistor that is not connected to
the speaker.

#4: Install the ptt switch in line between the resistor and ground
which is the minus terminal on the speaker.

#5: Connect the .33 mf cap to the top of the resistor where the red
wire is.

#6: Connect the white signal wire from the condenser mic to the other
side of the .33mf cap.

#7: Connect the shield wire from the condenser mic to the ground side
of the resistor. This would be above the switch but on the low side of
the resistor. This is important because if this is wrong the battery
will only last a few days instead of a year or more.

#8: Connect the minus side of the battery holder to the ground point
that is the minus terminal on the speaker.

#9: Connect the positive terminal of the battery holder to the red
bias wire that comes from the mic element.

#10: Install the battery.

2094. Re: HTX202 low audio 2/2

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-08 00:00:00 UTC
From: Clint.Bradford@bbs.woodybbs.com
Message-ID: <6c0_9605082216@woodybbs.com>
Source record: 201581

(Continued from previous message)

#11: Check with a volt meter to check that the bias wire on the mic
is getting aprox 3.1 volts positve.

That should be it. The .33mf cap keeps the radio {red wire from main
cable} from seeing the ext dc from the battery. The ptt switch grounds
the resistor and causes the radio to key and completes the ground for
the mic element. When the radio is not keyed the battery is looking at
a high impeadance instead of the 3k impeadance the mic presents when in
circuit. I checked modulation on my rig by putting the HTX on a dummy
load at low power and listened with headphones to a scanner. this is a
good way to insure that all is well before you take to the bands. Also
I should note that this type of mod can be made to other brand mic's.
Before I tried the Radio Shack model I modified a MFJ-284.

The same principals are involved but in the case of the MFJ there is
more latitude in how you accomplish the mod. The ptt switch is dpdt on
the MFJ and only spdt on the Radio Shack. Having two sets of switch
contacts allows you to use one set to ground the resistor and the other
set to apply the positve voltage to the mic element. Applying the
positive voltage rather than grounding the mic is probably prefered. If
you use the Radio Shack mic you don't have much choice and will need to
use the grounding method on the mic.

Now there are better parts available to do this mod, a noise cancelling
higher sensetivity mic for instance. If you are interested in really
having a high performance mic send a self addressed stamped envelope
and I will tell you how obtain these better performance parts. Send the
envelope to:

Terrapin Sales
P.O. Box 12426
La Crescenta, Ca. 91224-5426

Another cool place for HTX-202 and HTX-404 info as well as other ham
related topics is at the following address.

http://ourworld.compuserve.com:80/homepages/wa3rvt/

Make sure you check out .

The above was located at:
http://pages.prodigy.com/CA/LA/htx202htx404/htx202htx404.html

Be careful if you chose the route of internal adjustment for the external
microphone audio. In so doing you will probably be in a position of over

deviating with the built in microphone.

I bought an MFJ-259 after the last round of discussion here and am very happy with it. The accuracy is excellent, although I suppose this could vary from
unit to unit. The AEA has a graphics mode, which the MFJ lacks, but I find the analog controls and meters on the MFJ very easy to use, probably easier than a digital readout. Of course, the MFJ wins on price by a hundred bucks or so. I'm not a big fan of MFJ equipment normally, but I think this product is a winner.

Have anyone written any repeater control software for a PIC processor??

I found a repeater IDer, but would like to find also the rest of a
controller:

time-out timer, PTT control, tail delay.

No DTMF or CTCSS, just the normal timers and latches which are needed

Message-ID: <31927BD4.113A@compuserve.com>
Source record: 201414

To all FT-10 owners;

If you are having problems with your FT-10 radio draining the battery while off;

Yaesu has a modification to the power switch which will be done under warranty.

The mod is not documentated fully yet so you may have to explain that your having a problem re above. (a phone call with a tech rep explaining this is my second radio with same problem and my previous invoice showed a switch mod done to 1st radio...tech said there were no mods yet for the FT-10 but upon research of my invoice found hand written paperwork with the power switch mod listed)

Any questions contact me.

I found the best code learning material comes from Wheeler Applied Research Lab. The product is called Code Quick. I had tryed other programs with a little success. I learned more code in three days with Code Quick than with the others in three weeks. It is an audio cassette program which sells for around 42.00. They can be reached at 1-800-782-4869. Good Luck!

I had the same problem recently Howard. I suggest that you get yourself a
bottle of Loc-Tite from the Hardware store. Remove the ferrule, apply some
Loc-tite to the threads and retighten. Once this is done you should have no
further troubles. As to a Tool I use a Jeweler's screwdriver to tighten it.

Hi Dave

No It did not occur to me, but that would let me put the hamstick back and put the 5/8 back on the 2M side, I will have to look around the flea market at dayton see what I can scare up Thanks for the idea.

Radiomatt (radiomatt@aol.com) wrote:
: Paging is in essence, an addressable broadcast. Since I don't think the
: FCC allows a one-way broadcast on any ham freq., I suspect it would be
: illegal. (The paging terminal (*data generator*) would probably be hooked
: to a phone line (a violation since the caller would control the channel),
: and if you used an answering service to generate the information, the
: operators would have to be hams.

Granting all this, let's assume that he intends to be paged by hams. In that case, some, if not all newer, radios allow you to set up the radio so that the squelch will only be broken by a specific DTMF code. The HTX-202 has that feature, for example. So, he could set the handheld to activate this feature (I forget what it's called, CTSS Squelch?) and tell his friends what DTMF code to send to activate his ht. Then when they want to talk to them, they send the DTMF tones and then can call him as usual. Then the squelch will break, he will hear his call and be able to respond. All other calls will be muted out. This would probably work best if not used on a repeater freq, as the tones might confuse the repeater. Also, if I remember right from when I played with this feature, he'd know he'd been called when he started hearing stuff from the ht, even if the other ham sent his call first then the DTMF tones instead of the other way around, since the squelch lock-out has to be re-set.

Just a thought, but probably not what he wants.

Red Locktite. (Though if you ever want to be able to replace the
connector, and you will if you connect and disconnect antennas
frequently, use optical balsam instead.)

> Has anyone found a decent tool for tightening this
> ring, other than a small screwdriver?

It is called a beam spanner, available from places selling tools to the
optical trade. You can make do with an old pair of dividers whose tips
you don't care about buggering up. Sometimes a pair of snap ring pliers
can be made to work as well.

The most likely reason you are having this problem is excessive
connecting and disconnecting of antennas to the connector. A BNC
is an *assembly* connector. It is only rated for at most a few
hundred cycles. It is not designed for daily connecting and
disconnecting. Eventually the female center pin will lose its
spring, or fracture, and you'll have to replace the connector.

Whoever says that the receiver in the FT-50R is poor needs to have
their ears checked. I have one and it will run circles around the
TH-79A/D for intermod rejection. The Icom W-31A will too. The only
thing that the Kenwood might have over the others is better Tx audio.
The battery life for the FT-50R is respectable. I have been getting 8
to 10 hours normal use from the FNB-41 battery pack.
Yes, there IS a mod for this unit. You may be able to get it from
Yaesu or from ArtSci. You can also program crossband operation within
one memory channel. As far as I can find out, the FT-50R will NOT
X-band repeat, but who needs an HT to do that?
I would recomend the FT-50R for alot of reasons. I cary both the FT-10
and the FT-50R and use them for A.R.E.S./R.A.C.E.S. They get the job
done!!!! If I need to X-band repeat, I use my Icom IC-2350 for that
purpose.

2109. FS: Radome Cellular Antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-09 00:00:00 UTC
From: kb5wix@aol.com
Message-ID: <4mtvb3$see@newsbf02.news.aol.com>
Source record: 201422

For Sale:
Radio Shack "Radome" Cellular Antenna.
This antenna is less than an inch high, and only four inches square.
Soft surface
magnetic mount for mobile operation. Includes ten foot cable and cellular
connector. Also works as an 800 MHz scanner antenna.

Antenna is brand new, and originally sold for $49.99.

Will sale for $20.00, shipped free in the Continental U.S. via UPS.

2110. FS: Weatherproof cellular/800 MHz antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-09 00:00:00 UTC
From: kb5wix@aol.com
Message-ID: <4mtv07$sas@newsbf02.news.aol.com>
Source record: 201423

For Sale:
Radio Shack Marine Cellular Antenna (Cat. No. 17-313).
> 4 db gain
> 32 inches long
> 10 foot cable with TNC connector

Great cellular operations in fringe areas, such as marine or cabin. Also great for scanner use for 800 MHz operation.

Antenna is brand new. Original price $59.99.
Will sale for $25.00, shipped free in the Continental U.S. via UPS.

Check out the articles on learning code by Dave Finley, N1IRZ at the following URLs:
http://hawk.nmt.edu:80/~bateman/sara/finley.morse.html
http://hawk.nmt.edu:80/~bateman/sara/finley.sm404.html

The second article deals with using the shareware program Super Morse and provides a link to download version 4.04. The newer version 4.10 is available from ftp.nuri.net or you can go to www.shareware.com and search for it. It's shareware and I think the registration fee is $20.

I commend you on your decision to learn the code. Just keep at it, it's not nearly as difficult as some claim.

The cause is basically an automatic protection circuit built in to most
new rigs. It keeps you from frying your finals when your SWR is bad.
Isn't that thoughtful? I wonder if RS builds that into their rigs?

>paging. I am looking for a basic 2M radio that I can put together and
>maintain.
well when considering to purchase it or not you have to determine what your
main objective is. I think as with the way it was with Heathkit kits, if you
compare bargain commercial rigs, you can probably get more for your money when
you compare finished products, with the commercia rig.

For example, the Yaesu 2200 was discontinued and was selling for around $250.
I believe it puts out 50? watts on high power had many memories and does lots
of bells and whistles type stuff that the TT can't even come close to. I own
one and use it every day in my main vehicle.

The reason I got the TT kit is that I love to build and operate equipment that
I have built. The TT cost $199 with non-dtmf mike and about $250 with
additional amplifier kit that will bring power up to about 30-35 watts. I
loved building the kit, it was one of the best designed kits I have ever built
(and I have come close to building about everyone on the market). You build in
stages and test and align after each stage. The quality of the parts and
directions is absolutely top notch. If you have some experience you will love
the kit. Some sections have the components very tightly packed.. so care needs
to be taken in building.

The rig doesn't currently come with DTMF mike, so there goes the autodial
without adding a RS or other 3rd party device or mike, it does have a
connector for packet, and very easy to get the rig on packet. There is no
memory scanning, which is my other minor complaint.

So bottom line .. feature for feature. the commercial rig will blow the doors
off the Ten Tec, but building the kit and using it was more than worth the
price for me. I am using as my shack rig, hooked up to packed with the local
repeaters programmed in .

2116. Fw: More facts on (Best Dual-Band Handheld)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-09 00:00:00 UTC
From: lpvwwwtp@cencom.net
Message-ID: <N.050896.200456.77@saranac_2nd_ppp_40.cencom.net>
Source record: 201429

Hi,
I called Radio City (which was the only ham outlet open after 6:00pm) and I got hold of a intelligent sounding operator who I squeezed acouple of facts out of. First of all, even though he sells Icoms, he seemed to feel the same about them as you felt. Secondly I got the price on the dual-band Kenwood HT (I think that thta means handheld) it was a rather steep $459 which he agreed was probably the best dual-band handheld. I poked further to find that the TH-79D has 5w transmit on 2 meter and less on 440Mhz. (which was apparently for safety reasons, it being a higher frequency and closer to microwaves) it had full 2 meter tx but only 438Mhz-450Mhz tx in 70 centimeter band. I then found that the FT-51R, Yaesu's competiton cost the same, but lacks cross-band repeating capabilities, and the easy-to-read dot-matrix display. The FT-51R did, however, have a spectroscope which I guess gives you a graphic read-out of full band activity. I think the operator said that cross-band repeating let the handheld act like a repeater with a band-offset. He went on to tell about the models more in my budget range (though if you feel the Kenwood to be worth the extra money, tell me). The Yaesu FT-50R is a tiny little dual-band (which has tx. capabilities of full 2 meter and 430Mhz-450Mhz) plus {brand-new} that goes for around $329, the man said that this lacked the ease of programming that the Kenwood has and it lacked the cross-band repeating {or maybe all repeating capabilities altogether} Once programmed, however, this hold more memories and will operate just as well {or so he says}. The batteries come with them, but sold seperately will cost $90 for the Kenwood TH-79D and $50 for the Yaesu FT-50R {these are the high-power battery prices) The kenwood has a standard BNC connector and the Yaesu an available, but not so common SCR (I think) connector. Your input is welcome! I'm leaning towards the FT-50R (which the man said he has been selling like hot-cakes) The Alinco DJ-G5T wasn't even mentioned (do you have any clues why he wouldn't recommend it?)

Wondering,
Turner Gutmann

i have had an 820h for a year now. still like it! higher rf output makes it difficult to use 10w solid state amps.

rx & tx audio is very good, noise blanker is only barely adequate, although about par for average rig.

satelite operation works pretty well if you are into that.

has many other features that are useful and fun....full featured fm with wide coverage on both bands and at the same time!

ssb operation is quite good holding its own with the others on the market.

enough said.good luck dk

You last post was very useful and informative. It is too bad Maxon ooops I mean Radio Shack didn't design the radio properly in the first place. The real problem with the RS radios is the poor quality assurance and lack of support in most stores. I don't expect an electrical engineer for what RS pays but I also don't expect defenctive returned equipment to be restocked for the next sucker ooops customer to buy. I really believe a new ham is much better off with real ham equipment rather than a RS piece that might or might ot work properly.

I haven't done the yellow wire mod, and my 706 behaves just like Gary's. I can't hear it in the next room, nor can I hear it outside with the hand held next to the antenna.

If this small amount of radiation is outside the part 15 specifications, then I have to wonder about some of the FM broadcast radios. I listen quite a bit to a semi local on 107.1 and the carrier generated by the local oscillator of a radio several cars away tuned to the local on 96.3 will trash my reception.

Please tell us which ham store fixes your Yeacomwood while you wait, or how far you have to drive to get to a ham store. I have a RS 4 blocks from my house, the closest (only) ham store in Houston, Texas (something like the 4th largest city in US) to me is on the north side of town 30 miles from my house, and the times I did make the trek I couldn't convince the guys sitting around complaining about how hams only want to buy used cheap stuff and won't pay for anything new, to get up and help me, so I left.

I really think your comments about the design and quality of the 202 are not based on fact, I see many hams here in Houston using the 202, and all I've talked to are pleased. I get great signal reports on the air, until I tell them the rig is a RS, then the signal report gets downgraded unless the other Ham is using a RS also.

I don't think the rigs are perfect, but the intermod rejection of the 202 is so far superior to anything else in the 2m handheld catagory I have seen working many public service events in downtown, I can't see why anyone in a large city would by anything but the RS HTX-202.

I just finished the any band receiver kit. The 29 dollar one. For the money it was a lot of fun putting it together, but don't expect too much from such a simple direct conversion receiver. It worked as soon as I finished,but in the booklet there is a test that you are supposed to do during construction that did not turn out as the book said. I called TenTec and quickly got a tech who told me that I probably would not get the results indicated in the booklet, but not to worry, everything was probably OK. (He said that I would not be able to induce enough Hum into the circuit to get the indicated results.) Anyway I had alot of fun building the enclosure and adding a few things to the basic kit, and even though I have not hooked it to a good antenna (using a 3 foot piece of wire on 40 Meters!) I have had acceptable results from the simple set that it is. My recommendation; If you want to play with a kit and do not expect too much from a simple circuit, spend the 35 bucks and get something that you can use to listen to some ham activity. Good for practicing code. Easy to put together. Use sockets for the two ICs. mail me if you want to discuss anything else. The 9 Band receiver is on the way (They had delays getting this to me) and I'll be looking forward to putting it together, and it will be easier because it includes all the parts. Even though I enjoyed fabricating an enclosure and adding switches etc, it took some time. I have also built one Oak Hills kit (40 meter Sprint) and I have a 20 Meter Explorer in a box waiting to be built. Ron Giuntini KB6GK (rong@slip.net)

Everybody just hold on . . .

First, check your voltage (carefully!).

If it is above 2.5V, just keep jammin'. Only worry if it is low.

Then, if it is low, you have nothing to lose by trying it yourself. I
used 2 AA's soldered in II while I took the old one out, and soldered in
the new one.

Then, I sent the board to VE6MGS who changed my RAM upper limit such that
I could rec up to 37 Mhz on the 751, but that is another story.

Bottom line . . check the voltage. If it is >2.5V leave alone.
If it is low, change it while having a backup wired in. Piece of cake.

Icom is a last resort for a botched job.

Is this a level comparison? Gary says his numbers are of IMD products relative to the amplitude of one of the two tones (wonder why just one, weren't the two equal?) Standard IMD performance is quoted versus a point 6dB ABOVE the individual and equal two tones, i.e. versus the PEP of the combined two-tone product. As I'm not sure whether Tom is using Gary's unorthodox standard or the more usual one which is used in the more recent ARRL lab reports (the ARRL changed to this format a few years ago), I can not be sure whether these numbers are indeed different or identical.

2131. New Standard Mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-09 00:00:00 UTC
From: Brian Gould <rmedic@frii.com>
Message-ID: <3191A6AB.5615@frii.com>
Source record: 201593

Hi folks.

Saw an add for A new Standard Mobile in Last month's QST. Of course I can't find the damn magazine now and I
can't remember the model number. But it was a Tri bander (6m-2M-70cm) that had extended RX on both VFO's and
210 memory channels, AM decode for air band, and a slew of other features. It sure looked intresting and at
that time I called Stanard and they said the radio would be availible "In April" since it hadn't been accepted
as of then by the FCC.

Hmmm. checked Standard's Web page the other day and no new info. I haven't seen it advertised yet.

Anyone have more details?

Thanks & 73's
Brian KB0MEP

Gary,

> The yellow wire mod works, and was apparently circulated by someone within
> Icom America itself shortly after the radio came out. My first reaction on
> reading this was to say "Hogwash!", but then I thought that maybe I ought
> to do some investigation first.

The Yellow wire modification was first written here in this news group. ICOM did not figure this out, some other owner of the 706 did so. When the yellow wire is cut it turns off the bandpass filter as shown on the block diagram that covers 60 to 200 MHz and turns on the 2 meter bandpass filter any time you tune above 60 MHz. There may be some receiver radiation because of this and the radio will not pass Part 15 after the modification. Remember Part 15 basically is a test where the radio is looked at for all possiable frequencies to see if the receiver is going to bother consumer electronics and such.

This is most likely no skin off any bodys nose but a manufacturer can not sell a radio that will not pass Part 15 where the receiver operates above 30 MHz, after the sell the manufacturer has no more responsibility as he can not control the owners actions. Although the manufacturer gets into the intent of the law and can bypass the letter of intent or fines could and will result with possiable loss of a type acceptance of a product. As you know amateur equipment, only the receiver is tested and only those receivers that operate above 30 MHz specifically. Amateur transmitters need only be compliant with Part 97 and are not tested by the FCC for any spurs etc. in the amateur service.
Manufacturered Low Band Linear Amps are the only device that receive an actual Type Acceptance, this to prove they do not cover 24 to 29 Mhz out of the box in the United States. In Canada this rule of course does not apply and amps sold there have full frequency coverage out of the box.

Anyway its a moot point, cut the wire, the manufaxcturer will not likely incorporate this " mod " into manufacturing.

The ALC coming for tje IC-2Kl which is 0 to - 4 volts is most likely not compatiable with Kenwoods required ALC voltage.

Hi Tony,

Very few standards seem to be followed in Amateur testing of products.
I've assumed Gary relayed the informaation correctly (in reference to a
single tone), so I've tried to use those reference values.

But my main point is this. Two tone tests are not good indicators of real
world advantages of one PA design over another, because they generally
fail to subject the equipment to the same conditions met under real
operating conditions. Contrary to Gary's claims, when properly designed
PA's using conventional triodes and tetrodes are tested with the same
method, neither one comes out a sure winner in IMD. Some tetrodes are poor
performers, as are some triodes...and the opposite is also true. But all
in all, both genders are about equal in the real world when **properly
adjusted and designed**. It's the simplicity of operation and design that
makes the grounded grid triode "shine".

Consider this example of the complexity of a comparison.

We don't know if adjustments were made to provide the best IMD performance
while watching the analyzer, or if the amplifier was tuned strictly by a
"recommended method" employing conventional meters. Uner laboratory
conditions and with an experienced operator watching the analyzer, the
tetrode and triode tuning will both be correct. In the real world, the
triode would have a huge advantage due to it's less complicated and more
forgiving nature. The tetrode is also more subject to dynamic changes in
grid voltages that may influence operation much differently under two tone

or voice conditions. The triode generally behaves the same under both conditions.

The only thing that can be technically said (with some assurance of universal truth) is tetrodes drive easier but are much more dependent on correct tuning and design, while grounded grid triodes employ less complicated supporting circuitry that is both easier to design and less critical to operate.

My main point, concerning IMD, is that ANY PA used with a high power amateur type exciter is best designed when using the full excitation level available. All of the solid state radios I've measured produce cleaner voice modulated signals when operated near rated output power.

Even if those measurements are an anomaly, the difficulty in keeping the control grid out of current and the screen in the proper current range is a major concern. The ALC and power control response delay problems in radios dictate designing the AB1 tetrode PA to use very near the peak drive available. Using 20-60 percent of the rated output, as some designs suggest, is an open invitation to splatter...particulary with an operationally sensitive circuit like a grid driven AB1 tetrode PA.

There's nothing wrong with recommending use of an inexpensive tetrode to save money, although it's technically damaging to list advantages that don't exist. False or exaggerated claims used to promote an author's product in a technical or historical article are especially damaging because they confuse people trying to understand basic technical facts.

Yes, many of the auto tuners do not have a wide range of impedances
that they will match.

However, it seems a little extreme that your inverted vee would
match in the center of the band and the tuner would not get you to
the other end. Check the SWR over the whole band to see what is
happening. Sounds like your inverted vee could use some adjustment
anyway :-) .

The auto tuners are really fine, don't get too discouraged. I have
used a "G5RV" style antenna with my TS 440 with auto tuner and I
was able to match on all bands 80-10 (but 15 meters had so much loss that
it was useless :-) . It just takes some adjustments of your antennas
to get them "close enough".

Hello!

Time to move on to bigger and better things.

I have the following for sale.

Kenwood TS-50 (manuals, mic) 100W HF $600.00

Azden PCS-7500H 6mtr FM 50 w (manuals, mic, box) $300.00

Radio Shack HTX-212 45W 2mtr FM (manuals, mic, box) $200.00

All are in exelent condition. TS-50 does not have original box.
All prices are firm. Will ship for $10 extra (per rig). Cannot hold
items for "maybes", first come first served. The TS-50 was purchased
new on 2/2/94, the Radio Shack and Azden rigs were purchased 6 months
ago.

I can be reached at the following:

It doesn't matter which method is used, as long as it is clearly stated. It is assumed, when comparing to one of the tones, that the two are of equal amplitude.

Paging is in essence, an addressable broadcast. Since I don't think the FCC allows a one-way broadcast on any ham freq., I suspect it would be illegal. (The paging terminal (*data generator*) would probably be hooked to a phone line (a violation since the caller would control the channel), and if you used an answering service to generate the information, the operators would have to be hams.

Speaking of RELM, the company that bought the commercial radio section of the old Regency corp, I've dealt once with RELM and was very satisfied.

Someone gave me an old clunky 4-channel rockbound Regency BTL-304 39 mhz mobile radio, and I was able to buy a manual and 50 mhz/6 meter conversion parts from RELM with a fast delivery time. Although the service manual was fairly expensive, the other parts were reasonable and delivery was quick.

(My friendly local tech who did the 39-to-52mhz conversion said it was very difficult to retune, BTW. But the conversion did work fairly well.)

Hi,
I did the keyboard mod to the W31A to get it to rx between 50-300MHz.
However, I don't seem to get anything below 100 MHz even though I seem
to be able to tune down to 50 MHz. I do have (what seems to me) to be
a very low serial number (01453) -- I wonder if there was a problem with
earlier units? Any suggestions?
...thnx,
...dave alden

I have the later model, a TM-231 and have replaced the battery. The '221 looks somewhat similar so at least as a hint try looking behind the front panel. As I recall, I had to disassemble the rig to the point that the control panel was separated from the body and I could then remove at least one circuit board to get to the battery.

I believe it is a relatively common type (Radio Shack stuff). The only guidance I got from the manual was that when the battery dies, send the rig to them.

To say the least it's inconvenient and it did require a lot of patience and a couple of re-tries to get the parts back together.

Good Luck,

Frank, AB0G

I friend of mine designed (and sells) a device that (among MANY other
things) pages him... He has a radio set up on a simplex freq and it
listens for the proper series of DTMF digits. When heard, his device
picks up the phone and pages people via a standard pager.
There are 8-10 people set up on this and it works well. (purpose being
to page a ham to a frequency) The messages are in the form of the
freq. and a number that identifies the person that is paging. It
also has a feature that pages the person that started the pager, so he
knows it went through. (ie he was not out of range, or too noisy to
decode)
I know this is in reverse of what you seem to want, but I thought
I'd toss is out here anyway...

Ernie,
The object of the game is to guess the other number so the total is ten!
exp; the radio pick a secret number (say it's 3) you have to pick the
other number (7)((process of elimination)) as to get a total of 10...The
radio keeps track of your success and displays score after 10x

Hi Gary,

Just a few more corrections of more errors in your last reply.

In article <1996May10.172521.21411@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us
(Gary Coffman) writes:
>Well, lets look at some numbers. If we assume that there is a stray
>100 pf between cathode and V- (and that's a very high estimate), we're
>looking at a TC of 30*100E-12 or 3E-9 second, or 333.33 MHz. That seems
>safely above HF to me.

Once again you are using the time constant, and that is an incorrect
formula in this application. 100 pF is significant at the upper end of HF,
especially since it is the RF impedance that is important.

>>Your claim incorrectly implies RF speech processing at RF frequencies
>>without distortion by some strange "happenstance" or "coincidence". It
>>relies on a new load line "happening to be correct and linear" as
>>effective screen voltage is reduced and grid bias increased from
excessive
>>drive.
>
>There's nothing happenstance or coincidence about it. It's inherent
>in the 3/2 power rule.

Once again you've applied a rule incorrectly. That "rule" is not
applicable to dynamic power control when linearity is a concern.

>>The parameters "reducing gain" in your example also move the tube
towards
>>non-linear operation.
>
>According to "Care and Feeding of Power Grid Tubes", best IMD response
>is obtained with the lowest screen voltage that will afford sufficient
>gain to make the desired output power. (Section 4.4.4 p75)

Once again you've looked at a small part of the problem and jumped to an
incorrect conclusion. You've incorrectly assumed a condition met in steady
state operating conditions that always includes a proper REDUCTION of
control grid bias (to keep the conduction angle high) somehow universally
applies to a time varying voltage drop across the cathode resistance that
INCREASES bias and moves the tube towards short angle (class C) operating
conditions.

>Point taken. The dynamic screen impedance is 14k in this example, which
>gives a TC of 0.0014 second or 714 Hz. The supply dynamic impedance looks
>like it is roughly 600 ohms, or a TC of roughly 16 kHz. Both seem well

>above the basic 95 Hz rate.

My point wasn't completely understood. Again you've ignored the restriction on allowable voltage change, wrongly assuming the value used in defining TC gives the proper parameter. I have no idea what values you've used to determine the impedance of the screen or power source. But the most glaring error is concluding a TC **FASTER** than the modulation rate is good, when (if that were the correct parameter) we really want one much **SLOWER** than the modulation rate! We want to hold the screen voltage very steady, not allow it to move around.

>I'm not competent to address that.

Agreed.

>Well, lets see, 3rd order is 2 db better for the tetrode, and fifth
>is 6 db worse than the test data you report, but were those tubes in
>a MLA2500? If not, then they don't represent comparable performance.
>See QST March 1978 for the ARRL lab test of the MLA2500 with 8875s.
>They show
>
>3rd order -35 db
>5th order -37 db
>7th order -45 db
>
>Now *in the same amplifier*, the tetrode mod yields 6 db better
>3rd order, 1 db better 5th order, and 10 db better 7th order
>performance.

Again we have no way to verify how the measurements are done. Eimac's data shows the 8875 is typically -41 dB third and -42 dB fifth below a single tone of a two tone test without negative feedback. My data was also in that ballpark. As I said earlier:

"8875 measured third order (one measured sample of a pair of tubes 1980 data) : -39 dB third, -44 dB fifth at rated output."

>>All I've EVER said is the grid resistor was poorly selected, the claims
of
>>tetrode superiority are incorrect, and the bashing of Eimac was in poor
>>taste and totally unwarranted.

First you claim:

>Indeed you have. You've charged the authors with poor selection of the
>grid resistance (IE poor design skill), you've charged the authors with
>making incorrect claims (IE lying, or at best being grossly mistaken),
and
>you've charged the authors with bashing Eimac (one would assume unfairly)
>while pushing another vendor's product (IE with being venal and
dishonest).
>You're right, you're not calling them stupid, you're calling them much
>worse.

Then you say:

>The author says it will substitute for ALC under the conditions in
>which he instructs you to use the amplifier, but he does include a
>circuit to detect overdrive of the control grid, and warns you in
>the tuneup instructions to pay attention to it. I'm not too impressed
>with this circuit. It is a peak detector, but it lacks a hold feature
>which I'd consider necessary.

You must admit, this is ironic. You do exactly what you fault me for doing!

>You are assuming that ALC is being used for power control. That is
>unwarranted. Perhaps the author urges you to turn down microphone
>gain to reduce drive instead. Had you thought of that?

That doesn't cure the problem entirely, and now leaves the PA subject to varying drive levels if the operator moves closer to or further from the microphone. It also requires the operator to maintain the same voice level. That would be a very poor solution.

>Probably
>not since you admit you haven't read the article. (He actually
>doesn't tell you how to regulate drive, but you could regulate
>drive by turning down microphone gain rather than messing with
>ALC.

That would be a very poor way to control drive. ALC would actually be much more reliable.

>Or you could use a 3 db power attenuator if you liked.)

Which is exactly equivalent to the L pad I suggested earlier, it allows a 50 ohm load and makes the PA compatable with thee exciter. Thank you for finally agreeing with my suggestion.

>I don't fault you for complaining about poor IMD performance of
>some of today's exciters when their "power control" is turned down.
>That's probably true as far as it goes, but it shows a problem *with
>the transceiver* that should be addressed *in the transceiver*, not
>with the choice of tubes for an external amplifier.

Let me repeat this to be sure I heard what you really said.

1.) You agree the exciter works better near rated output, but disagree with changing the value of one or two resistors in the PA to make them compatable with each other.

2.) Instead, you think the PA should be designed for any drive power the designer desires, and the EXCITER should have its ALC and power control circuitry redesigned to match the PA?

>If you use ALC. If you disable ALC, that problem doesn't exist.

And other even more severe problems are created.

>Well then, let me just quote what Eimac has to say on this issue.
>From "Care and Feeding of Power Grid Tubes" again,
>
>"The main advantages of a tetrode over a triode are:
>
> <reasons a, b, and c, snipped as irrelevant to this discussion>
>
> d. Tetrodes allow designers to build compact, simple,
> flexible equipment with little spurious radiation.

So do triodes.

> e. Tetrodes permit the designer to build linear amplifiers
> with low inter-modulation distortion products."

So do triodes.

>So Eimac themselves tout lower IMD as an advantage of tetrodes over
>triodes (even theirs).

Actually the tout the advantage of *some* specially designed tetrodes in special applications. Eimac recommends triodes for 10 to 14 dB gain HF amateur type power amplifier applications, as would any experienced engineer.

The author of the 811 article simply failed to mention a triode uses a less complicated and expensive circuit and is much simpler to operate and more forgiving of mistuning or excessive drive. Only he knows the real reason why.

At least Eimac made their claims in **paid ads**, and never bashed or demeaned competitors (especially in free "historical" articles).

2161. Code Speed Change: Help Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-10 00:00:00 UTC
From: sco@sco-inc.com
Message-ID: <4n0hr2$1nr2@mule2.mindspring.com>
Source record: 201323

Did you know that 50 % of ALL U.S. Hams (about 340,000) are
either No Code Techs, Novices, or Tech Plus?
According to the A.R.R.L. that is true if I did my math right.

That means one half of us are now operating at 5 wpm or less code
speed.

Did you also know that there is NO international requirement for Hams
to operate above 5 wpm in the HF bands? Each country (read U.S./
F.C.C.) sets its own code speed requirements for its hams.

I asked the A.R.R.L. about this since I am a member. I was told that
the majority of U.S. hams support the current code speed requirements
for HF work below 30 mhz. [They didn't ask me.] They also told me
that this could be changed by a petition to the F.C.C. I would need
to submit a request for a rule change. If accepted it would go out
for review during a comment period.

My question is: Do we want to change the code speed so more of us
can use the HF bands?

I propose that the only code speed requirement for Hams in the
U.S. be 5 wpm. Classes of hams could still be distinguished by
different levels of written tests. But a 5 wpm code speed would allow
any class of Ham (except: Novice, Tech and Tech Plus) to operate phone
in segments of ALL the HF bands. This would essentially mean that
General, Advanced and Extra class Hams would only need to show 5 wpm
code to operate where they can now. Their written tests would stay
the same.

This would be a simple and effect way to allow ALL hams to upgrade
immediately by passing the higher level written tests. This would
preserve the historic code mode and also allow the hobby to rapidly
expand our ranks to preserve the future of HAM RADIO into the 21st
century.

Is anyone interested in helping me put together such an effort before
the F.C.C.?

I will be out of touch from May 15th until June 2nd (on vacation).

Send info if interested to: KE4IKT@sco-inc.com

2162. Re: Yaesu FT-101E Bands* "F" model *

I have the "F" model, which is the last in the series before the Digital Display FT-101ZD. The "F" model has all of the improved boards installed (as it is the last in the series). Most of all the major complaints of the early models have been corrected by the "E" models. You will have years of fun with this rig.

I also have the Fox Tango newsletters from the early 70's when the FT-101 was introduced. There must be 100 pages of measurements and improvements. If they wern't still copywritten, I would offer some of the mods/text/graphics.

2163. I Just Built A Ten-Tec 1056 Receiver

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-10 00:00:00 UTC
From: Ron Giuntini <rong@204.160.88.10>
Message-ID: <4n0j4u$m7j@news1.slip.net>
Source record: 201325

I put it in a homemade enclosure with a 2" speaker and it works. I built it for 40 meters and I pleased with it.
Thoughts during and after construction;

All parts present and instructions adequate and thankfully they assume some intelligence on the part of the builder. The manual is adequate but requires some thinking to identify the capacitators. Caps have a confusing system for identifying them, but the manual has a nice back page with info on this.
The board is fine, and there is not much to it. They give you an option on powering the two sections separately and it is a good kit to play with. The price is dirt cheap and since you can build it for any band it is fun to experiment with. I decided 40 was a good band since the manual confesses that in a direct conversion receiver the stability is better on the lower frequencies. It is satisfactory on 40. I have good audio out with a good signal. It takes slow careful tuning however. There is a way to get slower tuning by substituting a resistor but I have not tried it. Once I put it in a case and added an LED pilot light (1200 ohm dropping resistor) and a couple switches (Power and speaker on/off - earphone jack in line) I did not wish to take it apart to change any resistors. But I might recommend trying a different value to slow down the tuning. This will vary on different bands, apparently.
Anybody wishing to talk about this or other kits on the market please email me at rong@slip.net. I may or may not visit this group often enough to get your comments, but I will try. I am now waiting for the 1253 9band Receiver and think this will be easier because I will not have to scrounge the parts to finish it but that part was fun. In fact I am quite proud of the case I made out of sheet metal. I've built and used an Oak Hills Research Sprint (40 meter xcvr - direct conversion - 2 watts) and have an unbuilt Explorer (20 meter superhet xcvr) I guess I like building kits.. I have a couple of Heathkits that I built and really miss the Heathkit Company, I'm glad Ten Tec is taking up the slack and will supporting them .. I don't need a two meter xcvr but I'm tempted to buy one of theirs just to build it.,
I'd like to hear from anyone that has built other Ten Tecs.

2167. Review: JBI PC--Rig Control Kit

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-10 00:00:00 UTC
From: "Chris Smith, NR3O" <csmith1@ccgate.hac.com>
Message-ID: <4mvnck$qos@newsroom.HITC.COM>
Source record: 201329

I purchased JBI's radio control kit recently and was very pleased. It's a level convertor circuit board that fits inside a 25-pin D-type shell. It allows you to control a radio (Icom, Yaesu, Ten-Tec and Kenwood) from a PC serial port. They give you a complete kit including both radio & PC connectors, 6' of multi-conductor cable and even some shareware rig control & logging programs to get you going.

Cost is $29.95 and construction was simple enough. Mine worked right away without any problems (well, okay, I had to figure the darned software out first a bit). They also have assembled kits and a CW option. JBI's number is: 800-524-8658 (they have a machine, but called me back, even on a Saturday!).

I am now in the process of looking for some software I like, having tried a few already I was mixed about. DxBase for Windows95 (http://ve7tcp.ampr.org/Software/dxbase/dxbwpeek.html) is coming out to Dayton and will be available "this summer." Also AmSoft has a Windows version of AmCall (http://hamster.ivey.uwo.ca/~amsoft/amsoft3.html) coming out in "early" 1996 (isn't it almost *MID* 96 guys?). These look tempting...

I wanted to know, what band would you recommend for a soon-to-be licensed Technican class HAM in teh Cleveland, OH area (More specificly, Brooklyn OH)?

Ideally, I would love something with lots of toys like an ICOM IC-781, but I can't afford anything over $400 right now. I would like to find something used, If possable, at around $200, witha smaller antenna.

I am in a corner apartment, and I am not allowed to use an externa antenna, so I'm planning to use a mobile mount antenna, probably buy it from Radio Shack.

I'd like a base station transciever, but I would also buy a mobile if the price and feature would meet my needs; I do have a 120 VAC to 12 VDC 2.5A regulated power supply.

My biggest question is, what band should I go for? I want to start using phone, and I was thinking either 2 meter or 1.25 meter, but am not sure which is better, as I don't currently have a reciever to try and find activity here and don't personally know any HAMs in the area!

Thansk for your advice, either posted or E-mailed here, I appriciate it!

Why send this guy hard earned money when 99.5% of these modifications
are easily found on the net already for FREE?

Hey Jamie, why not buy an ad in a mag like Popular Communications,
then take advantage of net nebies?

Have a nice day>>>>>>insert smiley face here<<<<<<<<<<

I have one of these also. I found that it can have a little trouble "learning" a new antenna and "rejected" the antenna the first few times. I have been using it mobile, though with good affect. I have been able to get the Ten-Tec and Hamstick antennas to cover 100khz + on 75 meters with uniform field strength. (There was no detectable peak at the antenna's resonant frequency). 40 meters has complete coverage. It has worked well in that I don't have to get out and make adjustments roadside in the rain, ...

All this may be for nothing, for I may be upgrading to a screwdriver antenna.

It would be possible to build something using a DTMF decoder chip - lots are available. But there are nice HT's out there with DTMF paging built in, such as the Yaesu FT-11/41/51 series, it might be better to buy than build. I have the FT-11 and FT-51, and since my wife is also licensed, we would find this feature useful **IF** any repeaters in our area would pass DTMF tones. They don't. Since it only works for simplex operation, we never use it.

On another vein, members of the local BSRG (Atlanta area) repeater group got some used Motorola pagers which the repeater owner set up to be addressed through the 2M machine. It did work , but we never used it very much - at least not that I heard. It sounded good on paper, but it was usually just as easy (easier?) to pick up the mike and call. We probably kept our radios on more than our pagers.

Nevertheless, I am intrigued by this idea. Any other comments?

>
> Has anyone found a way of solving this problem?
>

If you attach an adaptor which is a BNC socket to Type N plug and put
this on your antenna, then you can simply make the antenna a push fit.
It will lack the captive properties if yanked but it can be attached
and removed without any twisting action which is causing your problem
and it will give a perfect r.f. connection.

You can use this trick for quick-disconnect on all sorts of sets and
instruments without any sacrifice to the constant-impedance of the line.

> modification, the warranty will be void and the customer will assume
> responsibility for the cost of repairs.

There's a 2nd part to this mod floating around which involves routing the
free end of the yellow wire to a unused hole in a circuit board toward
the front of the radio (sorry, I don't have my printout with me).
Supposedly this links into a switching transistor to keep the bandpass
filter from switching in until upwards of 120Mhz.

I've been putting off doing the yellow wire mod until I could determine
whether this 2nd part would be worthwhile or not. Can anyone post
pros/cons on this question?

(I'll do the tests on 75.352/144.365 as soon as I get home from work and
post results.)

>high side. I have to do this with my ICOM IC-765 to "peak" the tones.
>
>73 de Dave KD6TO

I've tried this setting. BTW, the HF default on the Kam (non-packet is
1955/2125). The best I can do at any setting, and on a strong signal, is
light the bargraph from left to one led right of center (hmmm... makes the tnc
sound political :-) Can you suggest the setting need inferred by this reading?

Tnx,
Larry

2183. Re: Narrow Filtering in TS-930 FSK kills KAM receive

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-10 00:00:00 UTC
From: leo@jove.com
Message-ID: <4mv7pg$21g@decius.ultra.net>
Source record: 201449

/>It's been a long time since I've played with a TS-930, but I suspect that aging of the
/>carrier oscillators (CAR 1-4) may have caused them to drift sufficiently that both
/>"mark" and "space" no longer fall within the 500Hz bandwidth of the filters (a not
/>uncommon problem in the TS-940). You should be able to get a pretty good idea of how
/>the filters are responding by tuning to a marker frequency and noting the S-meter action
/>when the dial is tuned to produce the requisite 2125/2295 Hz audio outputs. If one or
/>the other of these tones cannot be achieved with the S-meter at or near a peak reading,
/>you should perform Steps 1-4 & 8 of the RX Adjustment section of the Service Manual.
/>Hopefully, this should correct the problem.
/>
/>Also, it is very likely that use of the VBT with these narrow filters will quickly
/>reduce the effective bandwidth to less than is needed for good FSK. But this effect of
/>the VBT can be checked as suggested above: See how far you can advance the VBT and still
/>pass both the 2125 & 2295 Hz signals and still maintain a full S-meter reading for both.
/>
/>Good luck & regards,
/>Keith (KS9C)
/>
/>
/>You will probably get the best overall effect by utilizing the 500 Hz filters (with no
/>VBT) together with the outboard DSP when needed!

This seems to be the consensus. The best I've been able to do with some tinkering of the settings is light the led's from left to one right of center - on a *stong* signal. I'm going to
make an appointment with the radio doctor.

Tnx,
Larry

Hi nick -
A fellow posted the mod info a few days ago - I tried it on a friend's
radio and it works -
here it is:

Subject: Re: FT-50R info.
From: felix@netwizards.net (Anonymous)
Date: 28 Apr 1996 19:25:43 GMT
Message-ID: <4m0gnn$bf0@news.wco.com>

I have purchased the FT-50R and yes it is a pretty cool little
"radidio". I does have a built in game if yo press the MR button
while turning the radio on. I have also modified the radio to transmit
out of band.. MARs and CAPs ...Here is the information everyone needs
to modify it:

1. remove the battery pack
2. remove the two screws contained under the Battery safety sticker
on the back of the radio.
3. remove the key board (instuctions on how to remove the keyboard are
in the owners manual)
4. by removing the keyboard, it will reveal three jumper pads 1,2,&3
5. Only jumper pad #1 will be bridged by soldier.
6. remove the soldier from jumper #1
7. now, put the radio back together
8. reset the master cpu... instruction in owners manual.
9. reset the extended receive,.. see the owners manual.
10 you now have a modified radio.
any questions e-mail me (him, not me)

By the way, if anyone figures out what the object of the game is, let the
rest of us know!

Yes, and I also believe--in the laws of statistics and the criminal code. (At least if I can get caught.)

Look at http://www.usps.gov/websites/depart/inspect/chainlet.htm

Suppose one person makes $15K. Well, then they have gotten the equivalent of all of the entry fees of 3K people.

So, there must be 3K people getting $15K. So, they must have gotten the equivalent of the entry fees of 9 million people.

So, there must be 9 million people getting $15K. So, they must have gotten the equivalent of the entry fees of 27 billion people. Earth has 5.7 billion people.

In other words, this is a fucking fraud!

Most repeaters WILL pass or regenerate DTMF tones if you know the
correct command. Check with the trustee to see if this is allowed on
the system you use.

Avoid Fall Out!

Listening to music while you exercise or run used to be impossible. Walkman style ear buds fall out or misalign during strenuous physical activity and over the head headphones are uncomfortable.

Radio Partners builds custom ear molds to fit only in your ears. They then use Sony's state of the art Turbo ear buds as speakers. Together you have headphones that block wind/road noise, sound great and don't dislodge when exercising, running, skiing or rollerblading!

I can offer you repeater controller firmware that I wrote for the Intel
8031 that you could try to transpose into 'PIC speak'.
The trouble with the PIC is the limited resources like the stack. You
may have to write more inline code or use creativity to accomplish
some tasks. Might be a good exersize for you !

Well, lets look at some numbers. If we assume that there is a stray
100 pf between cathode and V- (and that's a very high estimate), we're
looking at a TC of 30*100E-12 or 3E-9 second, or 333.33 MHz. That seems
safely above HF to me.

>>>Moving the screen to cathode voltage around carelessly at
>>>an audio rate is absolutely the last thing that should be done in a SSB
>>>amplifier.
>>

There's nothing happenstance or coincidence about it. It's inherent
in the 3/2 power rule.

>The parameters "reducing gain" in your example also move the tube towards
>non-linear operation.

According to "Care and Feeding of Power Grid Tubes", best IMD response
is obtained with the lowest screen voltage that will afford sufficient
gain to make the desired output power. (Section 4.4.4 p75)

>>There's a 0.1 uf cap in parallel with a 180k resistor shown connected
>>right at the screen. That has a time constant of 0.018 second which would
>>seem to smooth response above the syllabic rate, IE above 95 Hz.

>insignificant part of the equation. It is the time varying load impedance
>of the screen that must be swamped out, and any poor dynamic voltage
>regulation in the screen supply that must be removed. In this case you've
>ignored the impedance of both the charging source and discharging load.

Point taken. The dynamic screen impedance is 14k in this example, which
gives a TC of 0.0014 second or 714 Hz. The supply dynamic impedance looks
like it is roughly 600 ohms, or a TC of roughly 16 kHz. Both seem well
above the basic 95 Hz rate.

>Once again, time constant doesn't directly apply. The problem demands
>careful consideration of the *amount* of voltage sag that can be tolerated
>at dynamically changing load rates. Using only the time constant, as you
>have done, allows much more voltage shift than good designs generally
>require.

I'm not competent to address that. Take it up with the author of the
article.

>>OTOH, the author of the article quotes the Swetlana data sheet for their
>>4CX800A as yielding a 3 db *improvement* in 5th order IMD with the
>addition
>>of the cathode resistor. I just went back and examined the ARRL lab
>report
>>graphs again. In what I hope is proper terminology, here's what I see.
>>
>>3rd order -41 db

>>7th order -55 db
>
>>All figures are db down from one tone of the two tone test signal, and
>>are interpolations from the graph. They might be off a db one way or
>>the other due to my interpolation.
>
>This data confirms this particular tetrode has poorer IMD performance than
>a grounded grid 8875 would produce. As I said earlier:
>"8875 measured third order (one measured sample of a pair of tubes 1980
>data) : -39 dB third, -44 dB fifth at rated output. Your reported data was
>-38 and -48 dB with negative feedback. Where's the "big universal tetrode
>advantage"?"

Well, lets see, 3rd order is 2 db better for the tetrode, and fifth
is 6 db worse than the test data you report, but were those tubes in

a MLA2500? If not, then they don't represent comparable performance.
See QST March 1978 for the ARRL lab test of the MLA2500 with 8875s.
They show

3rd order -35 db
5th order -37 db
7th order -45 db

Now *in the same amplifier*, the tetrode mod yields 6 db better
3rd order, 1 db better 5th order, and 10 db better 7th order
performance. *There's* your tetrode advantage.

>Now your data suddenly becomes even less supportive of your (and the
>author of the 811 article's) claims, with the tetrode 6 dB poorer than the
>triode in a laboratory test.

I don't know where your numbers came from, but mine came from the same
ARRL lab, testing 8875s in a MLA2500.

>>Again you're assuming the author of the article is stupid. Assume
>>instead that my attempt at explaining the article to you is what's
>>stupid.
>
>Stupid is a harsh and juvenile word. Please stop attributing words
>expressing your views to me. Quote me directly, but don't credit nasty
>words from your mind to me.
>
>All I've EVER said is the grid resistor was poorly selected, the claims of
>tetrode superiority are incorrect, and the bashing of Eimac was in poor
>taste and totally unwarranted.

Indeed you have. You've charged the authors with poor selection of the
grid resistance (IE poor design skill), you've charged the authors with
making incorrect claims (IE lying, or at best being grossly mistaken), and
you've charged the authors with bashing Eimac (one would assume unfairly)
while pushing another vendor's product (IE with being venal and dishonest).
You're right, you're not calling them stupid, you're calling them much
worse.

>>Now if the author indeed knows what he's doing (he is a Phd
>>with extensive tetrode experience according to the bio), the use of
>>a cathode resistor is *not* to cover up an error. In fact, in the
>>text he stresses the reasons he chose to use a cathode resistor
>>in the circuit, primarily to obviate the need for ALC and to use
>>negative feedback to improve amplifier linearity. The hopefully
>>correct two tone test data I've entered above would tend to confirm
>>his choice wouldn't you say?
>
>No, I wouldn't. While the resistor may or may not help IMD, I am more
>concerned by the low drive power required. It will likely cause the
>exciter to trash up, and makes the user depend on the radios internal
>power control circuitry. That circuitry has poor dynamic response in

>virtually every rig on the market today.

You are assuming that ALC is being used for power control. That is unwarranted. Perhaps the author urges you to turn down microphone gain to reduce drive instead. Had you thought of that? Probably not since you admit you haven't read the article. (He actually doesn't tell you how to regulate drive, but you could regulate drive by turning down microphone gain rather than messing with ALC. Or you could use a 3 db power attenuator if you liked.)

I don't fault you for complaining about poor IMD performance of some of today's exciters when their "power control" is turned down. That's probably true as far as it goes, but it shows a problem *with the transceiver* that should be addressed *in the transceiver*, not with the choice of tubes for an external amplifier.

>Secondly, a cathode resistor absolutely will not prevent overdrive or
>substitue for ALC circuitry.

The author says it will substitute for ALC under the conditions in which he instructs you to use the amplifier, but he does include a circuit to detect overdrive of the control grid, and warns you in the tuneup instructions to pay attention to it. I'm not too impressed with this circuit. It is a peak detector, but it lacks a hold feature which I'd consider necessary.

>A two tone test proves little with tetrodes in this application. Anyone
>experienced with modern solid state exciters and the ALC and power systems
>employed (and who has witnessed IMD measurements made on PA's tuned
>without aid of distrotion measurement devices) would realize a steady
>state two tone test under lab conditions is almost meaningless, and any PA
>that drives with less than the full output of the exciter is subject to
>consistant leading edge power overshoots from the exciter.

If you use ALC. If you disable ALC, that problem doesn't exist.

>The author of the 811 article made the statement "tetrode tubes were
>superior performers" in amateur HF applications, and he also directly
>reported Eimac high-mu triodes tubes were not designed for good "technical
>performance". You have repeated that very comment, and have attempted to
>support it with consistantly incorrect theoretical examples and circuit
>analysis.

Well then, let me just quote what Eimac has to say on this issue. From "Care and Feeding of Power Grid Tubes" again,

"The main advantages of a tetrode over a triode are:

<reasons a, b, and c, snipped as irrelevant to this discussion>

d. Tetrodes allow designers to build compact, simple, flexible equipment with little spurious radiation.

e. Tetrodes permit the designer to build linear amplifiers
with low inter-modulation distortion products."

So Eimac themselves tout lower IMD as an advantage of tetrodes over
triodes (even theirs).

And here are some of the things that they say about their zero bias
triodes in their advertising copy.

"Simple triode circuitry reduces components and results in
less downtime and failure." -Ham Radio Feb 75

"Want up to 20 times power gain in a cathode driven circuit?
Try one of the tubes in our complete zero-bias power triode
line. While you're solving problems, throw out the bias power
supply. Forget some of the associated circuitry." -Ham Radio Jul 68

"Operating in cathode driven service, these tubes typically
provide high power gain (greater than 13 decibels) in combi-
nation with low, low intermodulation distortion (3rd order
products less than -35 decibels below one tone of a two-
tone test signal). These excellent characteristics of the
8873 may be utilized up to 500 MHz." -Ham Radio May 71

Now contrast that to what they say about their tetrodes,

"In the power tetrode field we're defining the state of the
art by demonstrating imtermodulation distortion better than
any other known tubes. In 1966 we introduced the 4CX1500B
with the highest linearity then known, better than -40 db
3rd order IM distortion. Since then we produced the 4CX600J
a 600 watt tube with -45 db 3rd order IM products *without
feedback*." [emphasis theirs] --Ham Radio Oct 69

Note the superior numbers quoted by Eimac themselves for their tetrodes
over their zero bias triodes. Note too that they emphasize that they
get that without feedback, implying the numbers would be even better
with negative feedback. Note also the advantages they tout for their
zero bias triodes are "simple", "reduces components", "throw out the
bias supply". No claims of technical superiority, just simple, cheap,
easy. Now the author of the QST article merely repeated Eimac's own
advertising claims, but you took rather strong exception to that as
an attack on Eimac. If so, Eimac must have been attacking themselves
in the ad copy quoted above.

Source record: 201461

I would pick another choice than the Maxon GMRS210+3 I have had three of them. And have had nonstop troublr with them to this day. Mine have more time at Maxon Systems than in my hand. Radios had tone encoding problems,Short circuits, And the biggest problem to date is the Programming shorting out and reverting back to the Factory set channels. I had mine on my frequencies and when I turn it on All the tones and channels I had set were wiped out! Maxon never fixed this problem and they never said what they did to fix my radios. Normally, you would think there would be a explaination of what was fixed or replaced. Also the Maxon's are in a pretty cheap case. One drop and its all over for them. Yes I am dissatisfied with Maxon. That is why I am giving you some end user input before you buy. My advice Go with a Kenwood or Icom, A little more money but worth it.

Regards,
Bill

I own the MFJ and aside from recalibrating the resistance meter it has been fine. I also owned the AEA VHF/UHF meter. They don't tell you that the accessory software will NOT allow the meter to be run via a computer (HF meter will). I also am fortunate to own an HP8711B network analyzer and using its standards ($680 a set) showed that the AEA indicated 1:1 VSWR when the load was close to 75 Ohms- 50 Ohms indicated about 1.4:1. VHF was better but still 1:1 was above 50 Ohms. When I called AEA to discuss this I was told "that's about the accuracy you should expect for a $400 instrument- I sold it at the next flea market.

Frank was right on in his reply. The battery is located in the front panel assembly, and requires some disassembly to get to it. I don't know what the TM-231 is like, but the TM-221's battery is a common battery type (available at Radio Shack) except is has tabs "spot welded" onto it. That is a more difficult type to find. I removed the tabs from the old one and reattached them to the new one. Good Luck!

I have noticed that the display on my TS930 will dim from time to time as I tune across the band. I know that if the display blanks it means the PLL has gone out of lock, but this does not seem to be the issue. Has anyone else encountered this type of problem, and if so been able to fix it?

There was a modification tested at one time, it was SPUR city, the radio when out of banded transmitted spurs on a lot of frequencies so the modification information was destroyed and forgot. So no worthy modification information exhists for there radios.

Trying to remember back three years or so, I think my battery had tabs on it, also. The standard caveats are that soldering batteries is both bad for the battery and you you if it explodes. In a pinch, make sure the metal is clean and shiny, keep the heat and amount of time low, and wear eye protection.

I remember toying with the idea of bringing out a couple of leads and floating a battery holder in the main cavity of the unit. I didn't have the right holder, got lazy, wanted to use the radio, etc. so I didn't and I'm sure I'll regret that when I need to replace it again.

We have started a IRC chat area for use of ARES groups nation wide. As another way the stay in contact during a disaster. I thought members and non members of ARES RACES or other Disaster communications might be interested in joining us.

Use your Internet browser to go to the address (URL) below. Download verison mIRC 4.0

http://www.sbcomp.com/mirc/

This program will allow you to enter the IRC chat rooms around the world.

Once you have downloaded the program, you will need to unzip in into a directory named MIRC. This is done by ckicking on file mgr. then of file, then on create directory. Type in MIRC and click OK. Then move the file into the new directory and unzip the program.

Once this is done, go to your program manager window, click on file, then new program group. When the box opens. fill in the blanks and add the icon from the MIRC file.

Use the 16 bit verison instead of the 32 bit. It works much better.

Once you have the program running, dbl click on DALnet:phoenix.net [USA]
You will get another box with a list of rooms. in the empty top box this this:
#ARES/RACES
or
#ARES
All 5 letters plus the # sign this is important to getting in the room.

Source record: 201355

>>The problem stems from the deviation adjustment
>>telling the guy to speak into the mike is a cheap shot.

Excuse the heck out of me. I just experienced an Amateur with the exact same problem as described. When he was advised that the mike was on the bottom right of the face of the speaker/mike, his audio improved tremendously.

No "slight" to the original poster was intended. I only report what I have experienced first-hand or what I have garnered from reliable sources.

Here's a "low audio/external mike" text I found:

The following information regarding low audio with the HTX-202 was found at:

http://pages.prodigy.com/CA/LA/htx202htx404/htx202htx404.html

Title : Low ext mic audio on the HTX-202 and HTX-404

If you own the HTX radio you probably already know about the low external audio problem. I have tried a few different brand mic's and they all failed to get any significant audio into the radio. There is a good reason for this. The problem is the radio does not provide enough voltage to properly bias an ext condenser mic. When the radio is keyed the voltage at the ext condenser mic drops to about 2 tenths of a volt. Most common condenser mic's need a minimum of 2 volts and a nominal of about 4.5 volts. Design flaw or design feature. You be the judge. There is an easy way to get around this. I will tell you how to modify the Radio Shack speaker mic to get very respectable audio out of it. You then will be able to amaze all the smug Yaesu and Icom owners that have looked down at your HTX rig.

You will need the following parts from your friendly neighborhood Radio Shack

cat num,..... description,..... generic

19-310..... speaker mic

270-430..... lithium batt holder.... 20 mm single cell

23-162..... lithium battery..... dl2032..3v 180mah

270-092..... condenser mic..... -65 db sens 2v-10v

.33 microfarad cap,disc type or any small profile type cap

At this point I should say that this is a " use at your own risk"
modification. It is not approved by the manufacturer and if they knew
it would probably void your warranty. Any damage to your radio because
of an incorrectly implemented mod to the speaker mike is solely your
responsibility.

Now having said that, probably the only thing to happen if you blow
the mic mod is that the mic won't work or you won't be able to key the
radio from the external ptt switch. They made the radio hard to hurt
through the ext mike jack.

#1: Unsolder the ptt switch.

#2: Cut the leads to the mic element and remove original mic.

#3: Connect the red wire from the main cable that was going to the
ptt switch before to the side of the resistor that is not connected to
the speaker.

#4: Install the ptt switch in line between the resistor and ground
which is the minus terminal on the speaker.

#5: Connect the .33 mf cap to the top of the resistor where the red
wire is.

#6: Connect the white signal wire from the condenser mic to the other
side of the .33mf cap.

#7: Connect the shield wire from the condenser mic to the ground side
of the resistor. This would be above the switch but on the low side of
the resistor. This is important because if this is wrong the battery
will only last a few days instead of a year or more.

#8: Connect the minus side of the battery holder to the ground point
that is the minus terminal on the speaker.

#9: Connect the positive terminal of the battery holder to the red
bias wire that comes from the mic element.

#10: Install the battery.

2220. Re: HTX202 low audio 2/2

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-11 00:00:00 UTC
From: Clint.Bradford@bbs.woodybbs.com
Message-ID: <6e6_9605111440@woodybbs.com>
Source record: 201356

(Continued from previous message)

#11: Check with a volt meter to check that the bias wire on the mic
is getting aprox 3.1 volts positve.

That should be it. The .33mf cap keeps the radio {red wire from main
cable} from seeing the ext dc from the battery. The ptt switch grounds
the resistor and causes the radio to key and completes the ground for
the mic element. When the radio is not keyed the battery is looking at
a high impeadance instead of the 3k impeadance the mic presents when in
circuit. I checked modulation on my rig by putting the HTX on a dummy
load at low power and listened with headphones to a scanner. this is a
good way to insure that all is well before you take to the bands. Also
I should note that this type of mod can be made to other brand mic's.
Before I tried the Radio Shack model I modified a MFJ-284.

The same principals are involved but in the case of the MFJ there is
more latitude in how you accomplish the mod. The ptt switch is dpdt on
the MFJ and only spdt on the Radio Shack. Having two sets of switch
contacts allows you to use one set to ground the resistor and the other
set to apply the positve voltage to the mic element. Applying the
positive voltage rather than grounding the mic is probably prefered. If
you use the Radio Shack mic you don't have much choice and will need to
use the grounding method on the mic.

Now there are better parts available to do this mod, a noise cancelling
higher sensetivity mic for instance. If you are interested in really
having a high performance mic send a self addressed stamped envelope
and I will tell you how obtain these better performance parts. Send the
envelope to:

Terrapin Sales
P.O. Box 12426
La Crescenta, Ca. 91224-5426

Another cool place for HTX-202 and HTX-404 info as well as other ham
related topics is at the following address.

http://ourworld.compuserve.com:80/homepages/wa3rvt/

Make sure you check out .

The above was located at:
http://pages.prodigy.com/CA/LA/htx202htx404/htx202htx404.html

Be careful if you chose the route of internal adjustment for the external
microphone audio. In so doing you will probably be in a position of over

deviating with the built in microphone.

If memeory (no pun) serves me right, it is on the back side of
the front module. It is not the easiest thing to get to, but
once all apart it is straight forward. Be sure to use a
grounded soldering iron, and reset the radio after
installiation. Hope I remembered the right radio, and that this
helps.

I would try a 900 MHz cordless; they boast a 1/4 range, which,
hopefully, would be sufficent for you. Their biggest problem, that I
know of, is the fairly short battery life of only a day in standby,
but hopefully you don't need this cordless 24hrs a day.

They're available at many places, but you could start at Radio Shack
and price them there. I also bvelieve that J & R Music WOrld is based
in New York (I don't have a catalog handy) and they sell them as well,
if I'm not mistaken. The biggest catch they have is the $200 to $300
price tag, but that';s much cheaper and other long range solutions,
most of which are illegal in the U.S. because of the frequencies they
use.

If that doesn't work, I wish you the best of luck; maybe someone else
can help you.

Well The 528a was my first radio. I love it. I have used many
differnet hts and I have not seen one that comes close to the 528a. One thing
you might like about it is the mods. You can open the radio up by a key
sequence. Cool huh. If you have any questions just send me e-mail!

2229. HTX-202 Leaking Oil!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-12 00:00:00 UTC
From: Bill Meara <w.meara@codetel.net.do>
Message-ID: <4n3u85$su2@server2.codetel.net.do>
Source record: 201266

Well actually its contact cleaner and its not really leaking from the HT. My HTX-202 periodically loses the ability to switch to the "high power out" mode. With the help of members of this group, I was able to determine that the problem is caused by bad contacts in the hi-lo power switch. I went in, applied a few drops of contact cleaner and the problem was fixed... for a while. Now I find this radio is hooked on contact cleaner! I have to go in and give it a squirt every few weeks! It also seems that if I transmit for a while in the low power mode, the loss of the high power option soon sets in.

I'm not adept at microsurgery so I don't really want to start looking for a new switch. Any ideas on an easy way to fix this thing? I'm running out of contact cleaner! I don't mind running QRP, I just don't want to be forced into it!

BTW anyone have a set of the kind of screws used to fasten the HTX-202 back plate to the rig?

2232. WANTED: Info on Mosley window-mounted antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-12 00:00:00 UTC
From: mc@shore.net
Message-ID: <4n4mmf$g18@northshore.shore.net>
Source record: 201269

I recently acquired an interesting portable antenna made by Mosley in St Louis MO.

It is a small three-band trapped vertical that mounts on a wooden board. This slides under the window and is held in place by a clamp. The antenna mounts into a chrome-plated flange at one end of the board. There is an antenna tuner at the other end consisting of a roller inductor and variable capacitor in series covered by a plastic box. There is a SO-239 collector on the bottom of this board and a couple of knobs; one at the end to turn the roller inductor and the other on top to turn the variable condenser. There is an indicator and window that moves with the roller inductor. Also there is a second board-type piece and I am nor exactly sure what it is for. This system is extremely well built.

Does anyone have one of these antennas and willing to copy the documentation? I'd gladly reimburse costs.

>Thank you.

>Howard, n1vxs

I had the same problem. Sent it in for service three times, and the
same problem developed [loose antenna connection]. Believe that the
problem was from wearing the radio on the belt clip, the antenna would
be forced against my side when i bent down. Got it fixed by sending
in the radio to the service department (they had put a new BNC
connector in the radio on the second service), with a note saying.
"Try this", and taped a tube of "lock tight" to the radio. No
problems since, and since the service agency did it, I believe that I
can not be refused warenty, and also they have a record that the
little nut was held with lock tight, so if they have a problem in the
future with removing the nut, it's their problem, they knew about it.

I am trying to build a simple receiver to control a small solenoid that will operate a door latch. The force on the latch is only a few ounces.

I would like to use a garage door transmitter to send the signal to the receiver. Does anyone have any suggestions about how to do this?

I am *not* an electronics expert but I do have a basic understanding. If I can find someone who sells basic kits for receivers I think I can make this work.

If you have any ideas about where I should start please send me an e-mail.

Thanks!

Source record: 201282

You might also look for a different problem all together. If the problem comes after you use
the HT for a while, it may (underline "may") just be a transistor or other heat sensitive part
which is close to going bad. I'd suggest that the next time the hi power quits you, very quickly attach an ohm/continuity meter across the switch and close the switch. If the meter says 'ok', but the hi power does not come on, then your switch is not the problem.

I'm thinking that if this is actually the case, then your taking time to disassemble the radio
and apply tuner cleaner, etc., is allowing enough time for whatever it is to cool off.

In my experience, (ft470 vs dj580), the alinco was better at stopping
intermod and got less hot. The newer rigs (530 vs 582) seem to be just
refinements of the old ones so I would buy the Alinco without a second
thought...(sorry yaesu).

Source record: 201292

I have 2 HTX-202 HT's, one of which has developed the following problem. When I transmit at hi power with T-squelch turned on, the power indicationg lcd bars only indicate about 1/3 to 1/4 full power. If I turn off T-squelch, I get a full power indication. The next part is the screwy one; if I place an inline power/SWR meter on the rig, I then get full power output whether T-squelch is on or off! This doesn't make any sense to me (if the output stayed low, I would think maybe something was wrong with the tone generator).

I reset the rig, and this made no difference.

Anyone with any ideas? Tnx in advance. 73

-> >There isn't any harm in adding additional grounding electrodes or
-> systems. >The harmful situation is having independent grounds
-> connected to different >points in the house. What you want to avoid
-> are ground loops through the >house wiring.
->
-> Or your equipment! That's why you also have to account for paths
-> through your coaxes, control wiring, telco, etc as well as power.

Just catching up with this conversation, sorry for buttin' in, but...
I'm not sure if I follow this. Would sinking a ground rod outside my
bedroom(shack)window and grounding my rig to it be harmful? The earth
ground for the house is at the oposite end....I'd have to string 50' of
wire to it. Or, per chance are you speaking of hooking the ground wire
of the house to two separate rods?

I'm just starting out and this sounds like something that I want to be
correct on. Thanks.

2259. Re: IC-706 Yellow Wire Mod -- Con?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-12 00:00:00 UTC
From: com-com@t-online.de
Message-ID: <4n5n9j$1jc@news00.btx.dtag.de>
Source record: 201296

hier in old Germany gibt es Anleitungen fï¿½r ï¿½nderungen welche
den TX erweitern und die Empfindlichkeit auf 2m !

--

Hallo IC-706 Bastler,

von KE4ZV gibt es eine Umbauanleitung zur Verbesserung der Bandpaï¿½-
Durchlaï¿½kurve von 60-200 MHz. Meines Wissens ist der ï¿½nderungsvorschlag
eine Computersimulation. Mich interessiert, ob jemand den 2.Vorschlag schon
realisiert hat, d.h., ob Theorie und Praxis ï¿½bereinstimmen, und ob diese
ï¿½nderung auch DL-tauglich ist?
Die o.g. Bauteile befinden sich auf der PA UNIT, vor der Buchse 'EXT SP'.

Sinngemï¿½ï¿½e ï¿½bersetzter Originaltext:
Der Frequenzgang hat 2 Polstellen, eine bei ca. 136 MHz und die andere bei
160,5 MHz. Von 60 - 120 MHz ist die Durchlaï¿½kurve gut, mit Rippel < 4dB. Im
Bereich von 130 - 170 MHz ist der Verlust => -36dB, wieder ansteidend auf
-30dB bei 200 MHz. Die Spiegelselektion bei 280 MHz betrï¿½gt nur 26dB.

Modifikation 1:
Die bessere Lï¿½sung beinhaltet das ï¿½ndern von L49 (82nH) in 27nH, L40 (68nH)
in 22nH und C152 (20pF) in 30pF. Diese ï¿½nderung ergibt einen hervorragenden
Bandpaï¿½ von 60 - 200 MHz und hohe Spiegelunterdrï¿½ckung ab 280 MHz.
Lt. KE4ZV soll ICOM diese ï¿½nderung gutheiï¿½en und will sie einfï¿½hren.

Modifikation 2:
Da o.g. ï¿½nderung auch wegen Beschaffung spezieller Bauteile nur schwerlich
durchfï¿½hrbar ist, gibt es noch eine zweite Mï¿½glichkeit, die annï¿½hernd gleiche

Performance erreicht. C53 (20pF) und C153 (12pF) entfernen. Dann C152 (20pF)
durch drï¿½berlï¿½ten des ausgebauten C153 (12pF) auf 32pF erhï¿½hen. Diese ï¿½nde-
rung ergibt ebenfalls eine schï¿½ne gerade Durchlaï¿½kurve mit Anhebung des
oberen VHF-Bereichs und einer Spiegeldï¿½mpfung von -31dB bei 280 MHz.

Falls jemand damit Erfahrung gesammelt hat bitte melden!

ï¿½
ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½
ï¿½ Have a nice day, 73 & bye de Ed. Û°ï¿½
ï¿½

ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½

ï¿½ï¿½ï¿½ END OF TRANSMISSION fm DJ3FA-2 to DB0ABZ on 20.03.96, 10:02:31 UTC ï¿½ï¿½ï¿½

Most Common Failures and Cures for the Icom IC-706

Symptom: Low RX sensitivity on 2-meters.
Probable Cause: Burned D6 on PA unit.
Cure: Replace D6 (MA862).

Symptom: No TX power output on an HF band.
Probable Cause: Bad filter relay.
Cure: Locate and replace faulty filter relay (will be type
AHY-103).

Symptom: Low/distorted RX audio.
Probable Cause: Burned foil trace on PLL unit.
Cure: Repair SPE (ground) foil trace on PLL unit.

Symptom: Low TX output on HF & 6-meters.
Probable Cause: Shorted D18 and Q1 in filter unit.
Cure: Replace D18 (DAP222) and Q1 (2SC4081).

Symptom: Inadequate mic gain.
Cure: Install field mod on main unit: Change value of
R236 from 27k, to 68k-82k. ï¿½The higher the resistor value,
the greater increase in mic gain.ï¿½

Symptom: Thin-sounding mic audio.
Cure: Install field mod inside HM-103: Remove rubber
gasket from beneath mic element.

Symptom: Off frequency in FM TX.
Probable Cause: FM VCO lock voltage needs adjustment.
Cure: Adjust FM VCO lock voltage for 1.5 volts as per
service manual.

Symptom: Unit is stuck in TX mode.
Probable Cause: Shorted T/R switch transistor.
Cure: Replace shorted Q32 in main unit.

Symptom: Radio won't power up.
Probable Cause: Burned ground foil trace in flex cable.
Cure: Replace flex cable EP2 at main board.

Alles OHNE GEWAEHR (und ohne Kanone u.a.)!
##

Nach den ueblichen Modifikationen mit D59 und dem gelben Kabel
ist Tx zwar freigegeben, aber Leistung wird nur von 144 bis 148 MHz
produziert.
Nach langem suchen, messen und probieren kommt hier jetzt eine
Modifikation fuer den IC-706, mit der VHF-TX im bereich von ca.
140 bis 162 MHz z.B. als Steuersender moeglich ist!
Der Grund ist folgender:
(falls vorhanden, Schaltplan angucken !)

-Der beruehmte gelbe Draht ist das Signal B8W von IC31, Pin 13.
B8W ist Low zwischen 144 bis 148 MHz, sonst High, und schaltet
den 2m Bandpass.
-Das Signal B8 von IC31, Pin 14 ist High zwischen 144 bis 148 MHz,
sonst Low, und schaltet die Tx-Treiberstufe auf der Hauptplatine.
-Das Signal L8 von IC32, Pin 11 ist High zwischen 60 bis 199 MHz,
sonst Low, und schaltet die Pa zwischen HF und VHF-Betrieb um.
-Auf der PLL-Platine gibt es ein Signal, das zwischen 129 und
199 MHz Low ist.

Alles, was zum Betrieb von 140 bis 162 MHz noetig ist, ist folgendes:
-Die Signale B8W und B8 von IC31 abtrennen;
-B8W mit dem Signal von der PLL-Platine verbinden, der 2m Bandpass ist
dann in Betrieb zwischen 129 und 199 MHz, Rx-brauchbar bis ca. 170 MHz;
-B8 mit L8 verbinden, der Tx-Treiber ist dann eingeschaltet im gesammten
VHF-Bereich. Leider begrenzt ein Bandpass den Betrieb auf 140-162 MHz;
-Fertig, NICHT AUSSERHALB DER AMATEURBAENDER SENDEN !!!!!!

Und jetzt wird die Bastelei richtig aufwendig: IC31 und IC32 sitzen auf
der UNTERSEITE der HAUPTPLATINE! Diese muss also ausgebaut werden!

In der nun folgenden Anleitung ist auch die Modifikation mit D59
beschrieben, diese ist unbedingt noetig, stammt aber nicht von mir.

Werkzeug: ruhige Hand, Miniloetkolben, Kreuzschraubendreher, Pinzette,
etwas Kupferlackdraht und evtl. eine Lupe:

1. Geraet so aufstellen, dass die Front zum Operator zeigt. Gehaeusedeckel
entfernen und Lautsprecher herausnehmen.
2. Alle Leitungen von der Platine Trennen. Vorsichtig!. Die Flachbandkabel
lassen sich leicht entfernen und wieder einstecken, wenn man vorher den
oberen Teil des Halterahmens mit der Pinzette anhebt. Man sollte sich
vorsichtshalber merken, welches Kabel wo steckt...
3. Die 5 Halteschrauben der Platine loesen und die Platine herausnehmen.
4. -Falls noch nicht geschehen:
Diode D59 suchen. Diese laesst sich folgendermassen finden: Hinter den
Quarzfiltern befindet sich der Steckpfosten, von dem die
goldfarbenen Draehte des PVC-Bandes wegfuehren. Direkt rechts davon auf
der Hauptplatine befinden sich 5 Plaetze fuer dreibeinige SMD-
Dioden. In der Europa-Version sind von links nach rechts gesehen die
Plaetze 2,3 und 5 bestueckt, 1 und 4 sind frei. Der zweite Platz von
links enthaelt D 59. Siehe Bild:

D108

ï¿½ ï¿½ ï¿½XXï¿½ ï¿½XXï¿½ ï¿½ ï¿½ ï¿½XXï¿½
^^
D59

Nach vorn sind zwei Anschluesse (Anoden), nach hinten ein Anschluss der
Diode (Katode). Dies einzelne Beinchen muss abgeloetet werden, am
besten erhitzen und vorsichtig hochbiegen.

5. Platine umdrehen (Unterseite nach Oben).
Die beiden Bausteine mit der Bezeichnung uPD4049... suchen, es sind
16-Pin ICs, die entgegennesetzt montiert sind. Sie befinden sich in
etwa unter der grossen Blechkiste, welche auf der Platinenoberseite
aufgeloetet ist.

ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½
```

An IC31 Pin 13 und Pin 14 von der Platine Losloeten und hochbiegen.
Unter IC31 kommt links oben eine Leiterbahn heraus und fuehrt zu einer
Durchkontaktierung. Diese Leiterbahn kommt von Pin 14. In die Durch-
kontaktierung ein stueck Kupferlackdraht einloeten und zu Pin 11 von
IC 32 fuehren.
Das wars an der Hauptplatine!
6. Hauptplatine wieder Einbauen.
7. Den Stecker mit den Bunten Draehten Suchen, der hinten auf der
Hauptplatine steckt. Der 4. Draht von links ist ein gelber.
An diesem Kontakt muss ein Stueck Draht angeloetet werden, dass man
auf die Unterseite des Transceivers fuehrt.
!!!!! WICHTIG !!!!!
In dieser Modifikation bleibt der Stecker, wo er ist. NICHT Trennen!
Das Signal wurde schon an IC31, Pin 13 getrennt, das Signal vom gelben
Draht wird auf der Hauptplatine noch gebraucht.
8. Das UFO umdrehen und die Unterseite oeffnen.
9. Vorne rechts fuehrt ein Koaxkabel zu J8. links davon ist eine
Durchkontaktierung, von der eine Leiterbahn nach links zum mittleren
von 5 Transistoren fuehrt. In diese Durchkontaktierung wird der Draht
geloetet, den man Oben mit dem gelben Draht verbunden hat.

```
Leiterbahn---> ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½Ä¿
ï¿½ ï¿½ *
ï¿½XXï¿½ ï¿½XXï¿½ ï¿½XXï¿½ ï¿½XXï¿½ ï¿½XXï¿½ ï¿½-O *** J8
*
Draht in dieses Loch loeten^
```

10. Geraet in der umgekehrten Reihenfolge wieder zusammenbauen.

ACHTUNG: Wenn man jetzt D59 veraendert hat,wird beim Einschalten des Gerï¿½tes intern automatisch ein RESET durchgefï¿½hrt, d.h. alle programmierten Menue-Einstellungen gehen verloren und mï¿½ssen neu konfiguriert werden !!!

Das alles ist natuerlich ohne Gewaehr, und jeder ist fuer seinen Murks selbst verantwortlich.

Subject: Antenna Analysers

I own the MFJ and aside from recalibrating the resistance meter it has
been fine. I also owned the AEA VHF/UHF meter. They don't tell you that
the accessory software will NOT allow the meter to be run via a computer
(HF meter will). I also am fortunate to own an HP8711B network analyzer
and using its standards ($680 a set) showed that the AEA indicated 1:1
VSWR when the load was close to 75 Ohms- 50 Ohms indicated about 1.4:1.
VHF was better but still 1:1 was above 50 Ohms. When I called AEA to
discuss this I was told "that's about the accuracy you should expect for a
$400 instrument- I sold it at the next flea market.

There was a modification tested at one time, it was SPUR city, the radio when out of banded transmitted spurs on a lot of frequencies so the modification information was destroyed and forgot. So no worthy modification information exhists for there radios.

From: horizons@comm.net (Karen Elizabeth Johansen)
Subject: Internet Relay Chat for ARES

We have started a IRC chat area for use of ARES groups nation wide. As another way the stay in contact during a disaster. I thought members and non members of ARES RACES or other Disaster communications might be interested in joining us.

Use your Internet browser to go to the address (URL) below. Download verison mIRC 4.0

http://www.sbcomp.com/mirc/

This program will allow you to enter the IRC chat rooms around the world.

Once you have downloaded the program, you will need to unzip in into a directory named MIRC. This is done by ckicking on file mgr. then of file, then on create directory. Type in MIRC and click OK. Then move the file into the new directory and unzip the program.

Once this is done, go to your program manager window, click on file, then new program group. When the box opens. fill in the blanks and add the icon from the MIRC file.

Use the 16 bit verison instead of the 32 bit. It works much better.

Once you have the program running, dbl click on DALnet:phoenix.net [USA]
You will get another box with a list of rooms. in the empty top box this this:
#ARES/RACES
or
#ARES
All 5 letters plus the # sign this is important to getting in the room.

Subject: RS HTX-202 Low Audio

Please tell us which ham store fixes your Yeacomwood while you wait, or how far you have to drive to get to a ham store. I have a RS 4 blocks from my house, the closest (only) ham store in Houston, Texas (something like the 4th largest city in US) to me is on the north side of town 30 miles from my house, and the times I did make the trek I couldn't convince the guys sitting around complaining about how hams only want to buy used cheap stuff and won't pay for anything new, to get up and help me, so I left.

I really think your comments about the design and quality of the 202 are not based on fact, I see many hams here in Houston using the 202, and all I've talked to are pleased. I get great signal reports on the air, until I tell them the rig is a RS, then the signal report gets downgraded unless the other Ham is using a RS also.

I don't think the rigs are perfect, but the intermod rejection of the 202 is so far superior to anything else in the 2m handheld catagory I have seen working many public service events in downtown, I can't see why anyone in a large city would by anything but the RS HTX-202.

Well The 528a was my first radio. I love it. I have used many
differnet hts and I have not seen one that comes close to the 528a. One thing

you might like about it is the mods. You can open the radio up by a key
sequence. Cool huh. If you have any questions just send me e-mail!

Frank: Yes, your memory serves you well. I did the solder trick myself
too, BUT DON'T RECOMMEND IT TO ANYONE. If very careful, a successful
attachment can be made. I think I will try the leads and holder idea
next time, if I still own the radio.

From: mc@shore.net (Michael Crestohl)
Subject: WANTED: Info on Mosley window-mounted antenna

I recently acquired an interesting portable antenna made by Mosley in
St Louis MO.

It is a small three-band trapped vertical that mounts on a wooden board.
This slides under the window and is held in place by a clamp. The antenna
mounts into a chrome-plated flange at one end of the board. There is an
antenna tuner at the other end consisting of a roller inductor and
variable capacitor in series covered by a plastic box. There is a
SO-239 collector on the bottom of this board and a couple of knobs; one at
the end to turn the roller inductor and the other on top to turn the
variable condenser. There is an indicator and window that moves with the
roller inductor. Also there is a second board-type piece and I am nor
exactly sure what it is for. This system is extremely well built.

Does anyone have one of these antennas and willing to copy the
documentation? I'd gladly reimburse costs.

>Thomas
>tmilko@uninet.com.br

I would try a 900 MHz cordless; they boast a 1/4 range, which, hopefully, would be sufficent for you. Their biggest problem, that I know of, is the fairly short battery life of only a day in standby, but hopefully you don't need this cordless 24hrs a day.

They're available at many places, but you could start at Radio Shack and price them there. I also bvelieve that J & R Music WOrld is based in New York (I don't have a catalog handy) and they sell them as well, if I'm not mistaken. The biggest catch they have is the $200 to $300 price tag, but that';s much cheaper and other long range solutions, most of which are illegal in the U.S. because of the frequencies they

use.

If that doesn't work, I wish you the best of luck; maybe someone else
can help you.

From: Gearloos <gearloos@pacbell.net>
Message-ID: <319720B3.2099@pacbell.net>
Source record: 201212

Hi and thanks for the help in advance.
I have a Yeasu ft-890 with the auto tuner and it is hooked up to a vertical fiberglass 11 meter antenna that I cut down and matched to 10 meters for another radio. I have used the 890 on this antenna with good results (I get cw contacts on 40) but I have been told that I should not use it with this antenna. Why not if my match is ok (from what the radio thinks). the meter on the 890 says 1.2 or so to 1
thanks again...ke6ott

2265. IC-2350H Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-13 00:00:00 UTC
From: <>
Message-ID: <4n7dud$27la@ausnews.austin.ibm.com>
Source record: 201215

Hello All,
I bought a IC 2350H in March at a Hamfest and put it in my car a month later. Since I have put it in it has done a full reset many times. This has caused it to lose all the stations etc I had programmed into it. I have been careful not to push the buttons that cause a full reset prior to powering on the rig. It only resets as part of a power on.
Has anyone else had this problem with this radio? Other than this reset problem it seems to run like a champ.
The problem will occur with the engine running or not. The radio is wired directly to the batter and is double fused. I do not know if I have a bad CPU or not? I have spoken to ICOM and they have told me they no longer use a battery to retain the memory, but have a electronicly programmed eprom. A power spike could cause a memory loss. The only problem is I do not believe I have had such a spike.
Well the radio goes back today and I will let this forum know the out come of the service efforts at ICOM.
Have a good day.

Hello all,

Does anybody have any experience with the "patterned" sun shade at the
top of the rear window of
GM cars (mine is a 92 Chev Corsica)?
I'd like to install a glass-mount Larsen dual-band but I'm worried that
the patterning ink is
metallic (won't conduct RF power or won't allow the adhesive to stick
(that's bad too!).
The patterning is an array of dots that start large at the top and
shrink in size 3-4 inches
down from the top. They appear to be printed as some sort of paint or
ink.

Thanks

2272. Kenwood TH-78A recieve problem...HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-13 00:00:00 UTC
From: Nathan Odle <c670064@showme.missouri.edu>
Message-ID: <319767D3.402BB33@showme.missouri.edu>
Source record: 201222

I'm running the following:

Kenwood TH-28A w/programmable spkr. mic
RF Concepts 35W 2m amplifier
bandpass filter
Maldol dual-band antenna (the one with the highest gain rating)
RG-8M throughout the vehicle

My problem is that whenever I drive by the stupid pager tower, I start hearing a local TV station that is also situated nearby. I also have VERY high background noise levels wherever I go (they sometimes break the squelch even when it's all the way up!) The source of the noise is NOT vehicular, and only happens when there's a high gain antenna on it (like in the car, or in the shack). I assume I've got a case of intermod, but I've tried that bandpass filter (can't remember who makes it, but it's a good commercial-quality filter), to no avail. Anyone have suggestions? Please mail replies in addition to posting them...

2274. FT50-R Yaesu: NO FIX

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-13 00:00:00 UTC
From: Jerry Hogsett <jerry@hogsett.com>
Message-ID: <31973470.2CDA@hogsett.com>
Source record: 201224

I just spoke to a technician at Yaesu about the crappy audio in Wide FM mode on the FT-50R. She said that due to the size of the radio, they were only able to fit a 30-35KHz filter, instead of a 75KHz filter, for Wide FM mode. When I mentioned that this made the extended bands useless, she said that people in Japan are able to use it (I doubt that). She offered to fax me a list of FM frequencies I can listen to in Wide FM mode.

She said they were going to "fix it" in the manual and advertisements. She said there's not going to be a fix offered for the radio. When I said I wanted my money back, she called my bluff and asked me where I bought the radio.

I'll keep it, but I wish it worked as advertised.

2275. If money were no object

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-13 00:00:00 UTC
From: admin@hoptechno.com
Message-ID: <4n7s32$1ch@stratus.skypoint.net>
Source record: 201225

If money were no object, what would be the best hf tranceiver you could buy.
Further assume you would put it on a motor boat and go around the world.
Therefore you would need absolute reliability (no need for service ever - except
what a ham could do herself), excellent stability and sensitivity.
Assume that gimmicks and contest helpful trinkets are of no essential
value.

Phil

2276. Future HF xcvrs: Are any of you Radio Manufacturers Reading this ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-13 00:00:00 UTC
From: "Richard B. Harel" <rharel@fab8.jer.intel.com>
Message-ID: <4n7dg2$ms0@ilx018.iil.intel.com>
Source record: 201226

Here is a list of features I'd love to see the 'Big 3' Japanese manufacturers of AR equipment incorporate into their future HF xcvrs. Many commercial manufacturers have already incorporated many of these features.

1. Sylabic Squelch. - If anyone has ever used this feature, there's no going back ! This type of squelch opens upon detection of voice characteristics. JPS makes a plug in module with this feature that is sold to many commercial OEM's. Some include a 'gaurd tone' similar to a PL that reduces false squelch tripping.

2. Wide band digital receiver. - Imagine if every 10 minutes (if you so desired) your xcvr would transmit a digital packet containing your callsign, frequency and present time. Providing that everyone used the same protocol and the idea caught on, a wide band receiver built into your xcvr would constantly monitor the band and collect a list of 'who's on' and where. Interfaced to a PC, you'd be able to keep your xcvr on for a while and scan for several years until that rare station you've always been looking for from Yemen came on. Yes, a DX packet cluster does very much the same thing, but not everyone has access to them and input is not in real time.

3. ALE. - Automatic Linking. Many commercial xcvrs now use an ALE protocol to link 2 xcvrs on the most suitable freq. with the highest S/N ratio. True, we are much more limited in freq allocation, but it would still be neat to set up my xcvr with the same protocol with my friend's xcvr in London that would automatically determine that from the preset memories that we both have set up in our xcvrs on 14,18,21,24,+28Mhz, at this time 28.450 (i.e.) is providing the best S/N ratio. It checks other memories from time to time to see when this changes.

4. Alpha-numeric memories display. - With 99 memories in my FT-990, I have to remember what each one is or write it down somewhere ! Yaesu has done this for their VHF/UHF radios (FT2400/2500/7400) why not HF xcvrs ?

5. MORE MEMORY CHANNELS ! Rohde & Schwartz provide 1000 memory channels in some of their commercial receivers (EK870). This would not add to the cost of manufacturing in a significant way.

6. BITE - Built in Test Equipment. Many commercial xcvrs have BITE. If I disconnect module A19 in my Harris RF-590, next time I turn on the receiver, the display shows me that that module has a fault. This used to be very expensive to incorporate into equipment but technology is probably cheap enough to provide this for the equipment we use.

I'd be curious to hear your ideas and hope that the folks in Osaka are listening !

73,
Rich

You can buy a remote controlled AC outlet switch for much less than that from most home center (Home Depot, etc) stores. I had one (until it croaked - apparently from a power surge/spike). The xcvr xmitter pair came in at least 3 different frequencies. Press the button, the controlled outlet turns on. Press and hold the button for a couple of seconds and the unit turns off. You may have to design your own one-shot to activate the solenoid, perhaps modifying the receiver circuit so it doesn't latch on.

Issues of efficiency and shack RF aside, there is no reason not
to use the vertical, as long as it can be matched by the tuner.

For expending a great deal of money.. a Kenwood TS-870 or a
Yaesu FT-1000...

> Further assume you would put it on a motor boat and go around the world.
Than maybe a Kenwood TS-50S will be the ideal transceiver, because
it's so great and compact.
> Therefore you would need absolute reliability (no need for service ever - except
In this case maybe an self-built transceiver, will be ideal :)
I had a Ts-120S for 12 years without any problem or service, now
i have a TS-140 because it's similar to the TS120 and it has a
digital general all mode receiver.

Good luck,

There is no reason not to use those two items together. You may need to be slightly more careful regarding level setting at the rig, but AGC won't entirely replace the need to do that anyway. Remember that the majority of homebrew amplifiers (as well as many older commercial designs) do not include AGC.

In my own system, neither the transceiver nor the amplifier has provisions for this. Whenever I feel the need to drive the amplifier harder on SSB, I just turn on compression (processing) in the rig. That raises the average power without overdriving the amplifier.

>>
Therefore you would need absolute reliability (no need for service ever - except
what a ham could do herself),
<<
Dunno what the "best" rig would be, but in terms of reliability, as nothing is perfect, the aim is to have the highest probability that, at any given time, you will have a working radio.

Redundancy is the key here. Take three of them along. NASA does this all the time (in fact, they sometimes have five each of critical systems, like Shuttle computers)

If money is no object (and you have room), this is the way to go... and if money IS an object, it is statisticaly better to have several less reliable units, than one reliable unit. Further, with several different radios, you can have several different brands and types, to maximize your options in any case.

I don't know anything about changing any diodes. I prefer to keep the box closed.

You may want to call ICOM tech support to confirm this.
phone 206-454-7619
They are the source of the following info.

While power is OFF, press and hold buttons marked "B" and "♯".
While holding those buttons, press power ON and continue holding the power ON for 5 seconds.

All segments of the display are lighted during this few seconds.

RESULTS:
1) The VHF now tunes aircraft band
2) When in VHF band, SET MODE function can select 1 MHz digit as well as 100 KHz and 10 KHz digit
3) The UHF now tunes 300 to 999 Mhz. Well, at least the display will scan that range. Who knows if it can actually receive anything. I haven't used it much and have no test equipment to measure sensitivity.

I found the ICOM tech support rep to be very courteous and eager to help. I asked about the aircraft band. Nothing was said about the changes to UHF tuning. I just discovered it by accident while scanning UHF later.

2283. Mods for Uniden HR-2600

Hi,

I'm looking for mods for the HR-2600 by Uniden. This does not seem to
be the same as the 2510 because pins 34 and 36 are not tied together
and the processor unit is a 1251 instead of the 1201 used in the 2510.

Also need the dip switch settings for a 100hz tone.

Please reply by E-Mail

kj7az@coffey.com

Thanks

>Thanks
>Bob

Open the top and you will see an obvious green loop of wire about 1/2 inch long. clip it and your transmit will match the receive. I think you have to reset the cpu also. Worked on my 2500, did notice a little more intermod was getting through, like from none to once.

No guarantees have fun.

In article <31974F69.5048@tor.comm.mot.com>, louisb@tor.comm.mot.com says...

>Hello all,
>Does anybody have any experience with the "patterned" sun shade at the
>top of the rear window of
>GM cars (mine is a 92 Chev Corsica)?
>Thanks
> --Louis

I was told by the manufacturer of the antenna (Larsen) to avoid the patterned area. I used the area where the heater wires are about two inches below the bottom of the pattern and stratled the heater wires with the antenna coil plate horizontal (parallel to the wires). I did this on my Chevy Lumina which I believe is the same style glass as the Corsica and it performed well. After about 1-1/2 years, the glue started to seperate on the outside antenna, so I reglued it using contact cement and it was fine until I returned the vehicle (company car). Be careful to check the mounting regularly and DON'T exceed the power capability.

2291. Tm-421A mods

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-13 00:00:00 UTC
From: Ian Cummings <102152.1703@CompuServe.COM>
Message-ID: <4n87oj$3qi$1@mhadg.production.compuserve.com>
Source record: 201241

I have a TM421A kenwood 70CM radio and have been looking for
the mods to allow broader frequency coverage. There are mods
around talking about mods for this radio but they refer to
VHF frequencies and a green jumper (my TM421A is a UHF radio
and has no green jumper).

The manual refers to the TM421E and ES as european versions of
this UHF radio and it covers 435-440. Mine covers 438-440.
I desire to operate my TM421A from 435 to 438.

Kenwood of course will not tell me the mods to broaden coverage
into the 435 region (I suspect it isn't difficult as the E series
radio is covered in my A series manual).

Any help?? Thanks Ian KB1SG

Please email any replies to cummings@neca.com

I'm looking for my first Ham rig, and I wanted to know:

A) What is Radio City's phone number

-and-

B) By any chance, do they have a preferably free catalog I can get?

Thanks,

D> know. I will also give schematics if desired.
D>
D> dc@interaccess.com
D> Doug

Hello Doug,
I have been interested in building a Stereo FM Transmitter for
some time now. I bought two Kit's (Though they were not stereo)
and did not have a lot of luck with them. My goal is a
transmitter that can cover a range of about 3-5 miles, in stereo
would be great, and stay on frequency. My major problems with
the kits is that it jumped around alot not to mention it was
hard to tune on a particular frequency. I don't know too much
about the subject but would like to try to build one. Do you
have any more info such as the details on it after its
built.(Not too technical) Power Output, Gain controls, Etc., and
the cost of the complete package with the schematic. Thanks in
advance for reading. Looking forward to your reply.
Victor Vanderberg

You can order them at any Radio Shack for $1.99. I just got a set myself.
The Part # is HW1901120 They even delivered to my house tho they DID charge me
$1 for shipping on the tiny bag of screws. But I figure that the $1 is worth it
compared to me having to go to RS myself to pickem up.

2315. funny behavior of ft990

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-13 00:00:00 UTC
From: Vbendeb@cris.com
Message-ID: <4n6bef$hp6@tribune.concentric.net>
Source record: 201302

Hi guys,

all of the sudden my FT990 started to switch
modes on it's own. Say I'm listening CW on 20 meters,
the rig would sporadically switch itself into FM.
Sometimes this persists and hapens pretty often, say
once a couple of minutes, sometimes it works OK for
hours.

It'd be a great hassle to send it to Yeasu for warranty
service. I wonder if anyone have experienced anything like
these "sporadic switches" or have gone through the Yeasu
warranty service circles.

Any tips would be highly appreciated,
hope to meet you on CW or SSB 20 m. as opposed to FM,

Vadim Bendebury, VE3KKI

Go to the nearest sears store and buy a replacement radio kit- they
come with a receiver and either one or two transmitters.
The one-transmitter version should cost under $70. Cheaper than
building anything.

Or how about a L.O. of a fm broadcast radio two lanes over trashing
a 440 channel! The radio had enough oscillator "pull" so that
the modulation leaked back to the LO via the power supply that
I could hear the modulation well enough to ID the station
(100-101.something +10.7)*4.....
The other car (a Toyota Tercel) and I were caught in highway
traffic and paralell for about 15 minutes.

Boy! You are asking for alot. My advise; settle for a 2 meter mobile rig that you can use on low power with your (weak) power supply. No more that 5 or 10 watts using your 2.5 amp DC supply. (If people tell you that there is a hum on your signal it is coming from your possibly not well filtered power supply.) With this choice you can pick from a new or used rig. You can then take it to your vehicle and have a good time. (And run full power--25 to 45 watts) Be sure to run power directly from the battery terminals (fused) and you will eliminate alot of hum and whine. Do not ground the rig in the passenger compartment...keep the DC and antenna cables away from any car electronics...use a 5/8 whip. More advise will be available from the folks you contact on air. At the home you can use a modest or elaborate 2 meter antenna . Use RG8 cable and keep the run short. Once you are talking to the Hams in your area you will find all the options open to you. The limits are always time, money and space. Read the magazines. Try building kits. Try QRP cw on 40 meters.. (I'm afraid most new hams are appliance operators...try new things and get your soldering iron hot..read QST and BUILD something!!!) Have fun and there is alot of time and there will always be new rigs...try not to fall victim to the ads which after a few years will be less seductive and more informative to you.. Anything else? Oh yeah, the radios are for fun.. The less you spend on each one the more different ones you can buy.. The 781 !! I can't imagine being able to use all those knobs and switches and still have time to send CW or to talk to anybody...I would rather have a Scout (550 bucks and lots of cash left over for QRP kits, antennas, tuners, tools, meters, etc.) Give yourself time to decide what you want, but you will want 2 meters in your car so if you start on 2 meters (not the best band by any means, but one most hams have a rig on -- I have 4 or 5 two meter rigs...) It is not always the most polite band but you will find out...The antennas are easy to deal with and you can always sell a two meter rig if you tire of it... Then get on the low bands...then get your general and you will be REALLY licensed,,,,Enough for now, you asked for an opinion...you got mine...
Ron KB6GK

(I got this license in 1978...had to go to the FCC office to take the test,,,,walked in with no license and left with an advanced ticket...Never felt so good as I did that day.)

I am desperately looking for a Kenwood IF-10C for use with my Kenwood Ts-140S. I would like to use computer control of functions in the radio.

A gentlemen in Canada was going to send one to me to look at but I have not heard back from him. I wish Kenwood would produce a final run of these devices. I think I read elsewhere on this newgroup that there isn't anything fancy to what is needed, just a couple of chips? Is there a specific circuit board that goes in the radio, or just the chips? Does someone have the manual &/or schematic for the IF-10C that would be willing to send or fax me a copy? Please reply directly to me via my e-mail address which is: garyzab9@tcd.net

2327. HTX-202 Low Ouput Power

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-13 00:00:00 UTC
From: wb5rue@amsat.ORG
Message-ID: <01I4NKIIXIFQ0039FP@ARWEN.UTHSCSA.EDU>
Source record: 201364

```
- I have 2 HTX-202 HT's, one of which has developed the following
-problem. When I transmit at hi power with T-squelch turned on, the
-power indicationg lcd bars only indicate about 1/3 to 1/4 full power.
-If I turn off T-squelch, I get a full power indication. The next part
-is the screwy one; if I place an inline power/SWR meter on the rig, I
-then get full power output whether T-squelch is on or off! This
-doesn't make any sense to me (if the output stayed low, I would think
-maybe something was wrong with the tone generator).
-
- I reset the rig, and this made no difference.
-
- Anyone with any ideas? Tnx in advance. 73
-
-
- Steve N2QLQ
```

Well Steve,
Some of the HTX-202 (most of the first ones) had a severe problem
with sensitivity to RF getting back into the rig. This happened
mostly when used with the external microphone. Also, many were
hyper-sensitive to high SWR so they would drop the power to protect
the final transistor from excessive voltage. Your ducky might
be broken internally. I don't know what the T-squelch has to do
with it, that really is strange.

Sorry to post this article in the amateur newsgroup but it's
the only way for me to find a reliable OM. !!!

I'm planning to buy a Apple powerbook 5300 greyscale in
the USA for less than $1100, because in France, it costs
more than $2500...

I'm searching for comments about 'Macsale' in California...
Because I don't want to loose $1000 in one second !

Moreover, would any american Om accept to receive the
powerbook, to verify the computer for me, and resend it to
France via UPS or something like that ?
Everything will be paid before.

My call is F1ITT and you can contact me via Email
at
fbonnet@zen.dedal.fr.net

PS: if you know a reliable adress for buying a mac, please
inform me quickly (because 5300 greyscale is going to be
out)

PS2: I'm searching for the tel and fax number of J&R music world
in New York ?

Sorry for my poor english, If you can help me and if you speak
french, it will be fantastic ;-)

...

Well taken. The Ten Tec cannot (of course!) put out full power into
any load. They make an advertising claim that more power goes into
the antenna with higher SWR than the radios with SWR foldback
protection. I have never investigated the truth of this claim, though
it seems plausible. Ten Tec does not use SWR to foldback the power, they
check the current draw and shut down the power supply if it goes too
high.

Message-ID: <5e7cc$11271c.2ce@NEWS>
Source record: 201166
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I have a few questions about the Kulglass Antennas (Larsen) sold by Ham Radio Outlet. I am specifically interested in either the KG144PL (2m), or theKG2/70PL (2m/70cm).

1. Are glass mount antennas any good? I am using an HTX-202.
2. Does anyone have any experience with these two antennas?
3. Is the SWR a problem with this type of antenna?
4. Do these things really stay glued onto the glass at 'highway speeds'?
5. The window I would place it on has some tint ('94 Toyota truck w/ extend cab), would this be a problem?

Any other info is appreciated.
Thanks.

-Dan (N3XJN).

Hi, I was given several Motorola Commercial radios with the modle # Max Trac 800. What frequencys do these radios cover? Can they be programmed to operate on the Ham bands (2m or 70cm) and lastly, what are they worth, assuming they work. They appear to need programing to work> Thanks and 73. KD6ISK

2337. 1969 RCA Radio/Phono

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-14 00:00:00 UTC
From: Chuck Curran <ccurran@execpc.com>
Message-ID: <31993710.3295@execpc.com>
Source record: 201170
Cross-posted to: sci.electronics.repair,sci.electronics.equipment,rec.radio.amateur.equipment,rec.antiques.radio+phono

We are trying to repair a RCA Model VMT 68S stereo set, I guess
just to see if we can. It has an AM-FM chassis #RC 1238A and Preamp
chassis #RS-239.
The problem is the available schematics we've found show some
undocumented sections, which are those late sixty's style "thich film"
integrated circuits based on a ceramic substrate, sorta like what Sprague
made for years. What I hope to get a lead on are the following parts:

Z604 P/N 130315 (1410514-1) AF Amp

Z605 P/N 130334 (1410503-1) AF Amp

Z601 P/N 130313 (1410504-1) AF Amp

Z401 P/N 127982 (1462869-501) AF Amp

If anyone might be able to suggest a source for the circuits
inside these modules, it would really help. RCA indicated they no longer
support this type of equipment or have any information. A Sam's
Photofact for this unit is dated September of 1970 so it was probably
built in about 1969. Sam's just has the little old squares with the
leads going inand out but no details on the module itself. Thanks in
advance if you have any idea where to get a schematic of the insides of
these!

Regarding the FT890 antenna tuner making a good match on any frequency, I would think that if the antenna tuner can make a 1.2:1 VSWR the radio and you should be happy. I have taken my FT890 aboard ship where there have been some awful antennas to match and always been sucessful! Be sure to use minimum power when excersizing the tuner as it is possible to burn capacitors in the internal tuner. 73 Cliff Buttschardt W6HDO

And the Ten Tech folks in Tennessee, too.

My own wish list is completely different:

1) A GOOD computerized interface using the PC.
A Windows-style GUI interface that is customizable via drag-and-drop. (The
KW 870 has made strides in this direction.)

2) Upgradeable BIOS features via flash-rom, so that every time a new
feature comes out you don't need new hardware. For example, many features
of the Kenwood TS850 could have been made digital, and thus,
flash-rom upgradeable.

3) Digital oscilliscope, with the output via the PC interface.

4) DSP in the IF for receive and XMIT (natch).

5) Built-in TNC similar to the DSP 232.

From: msp@Deakin.Edu.Au
Message-ID: <4n92en$ieb@sol.ccs.deakin.edu.au>
Source record: 201375

Has anybody had any problems with recieve on their Alinco DR 130T ???

My radio TX's perfectly....switches back to recieve ok...and all functions work ok. THe only problem is that no recieve signal 'gets' into the speaker. Ie, I can transmit on a rig 2cm's away from the Alinco and the Alinco will not respond to this signal whatsoever.

The problem occurred over about a weeks duration. At the start of the week the recieve took about a minute, from power up to activate. Over the next few days, this activation time increased until, by the end of the week the receive was no-existant and the radio is currently useless.

Has anybody experienced this on their Alinco DR-130T. I suspect the uProccessor or the switching diodes..but I am not game enough to work around the SMD's. Any help would be appreciated.... Michael VK3KKH.

: > come with a receiver and either one or two transmitters.
: > The one-transmitter version should cost under $70. Cheaper than
: > building anything.

: You can buy a remote controlled AC outlet switch for much less than that
: from most home center (Home Depot, etc) stores. I had one (until it
: croaked - apparently from a power surge/spike). The xcvr xmitter pair
: came in at least 3 different frequencies. Press the button, the controlled
: outlet turns on. Press and hold the button for a couple of seconds and
: the unit turns off. You may have to design your own one-shot to activate
: the solenoid, perhaps modifying the receiver circuit so it doesn't latch
: on.

: - les

I also used a Radio Shaft remote AC outlet switch for something that I did, and I had to modify it to get it to work. The transmitter has both an on and off button on the top, and it's fairly large size.

The receiver has a power supply that operates off the AC so it's mickey mouse, and like yours it was subject to transient surges. What I needed to do was isolate the relay contcts from the AC line. So I had to butcher up the PC board a bit to get it to work. I removed the AC prongs and I modified the power supply to get the receiver and relay to work off a 12.6 VAC transformer. Then I wired the contacts externally so I could use them to control low voltages. My idea was to use it to interrupt the speaker leads so it would act like a mute button.

If this solenoid is powered off the AC then the remote AC control would be a good choice. But the AC can fail at times and then you're locked out. (We had a city-wide power failure today for more than an hour. It's funny how you don't realize how important the electricity is until you don't have it.) It's better to power it off a battery and trickle charge the battery (somewhat) continuously. And a 12V solenoid from a car is

probably easier to get than an AC version: there is probably a 12V door latch already made for this purpose. I had an alarm system that ran off a car battery, and the 2 amp trickle charger tended to boil the water out of the battery. So I put a cheap lamp timer between the wall and the charger and set it to go on for a few hours every day, and that solved the battery problem.

Is there an easy "user adjustment" to nudge the frequency back into place on an FT-1000D ?? Mine reads 40 to 60 cycles to the low side. (eg, Reads 14249.96 when it's actually on 14250.00). Problem has been confirmed and also occurs on other bands. Problem is common to both Main and Sub.

Hate to send it to factory. It's used (1993) with no warranty. I'd appreciate it if anyone is familiar with the procedure. I have some test equip- freg gen/counter, etc. ----or---- If anyone knows someone good with Yaesu tune-ups in the Connecticut area?? Thanks!,

I think you're mistaken. The output impedance of solid state rigs is fixed. Change the load impedance and the amount of power delivered to the load will also change. In addition, the bandpass filters at the output of the transmitter require the correct load impedance to insure proper rejection of unwanted emissions.

Hi, let me preface this by saying I'm the happy owner of a
Kenwood TH-79A(D) HT. Prior to purchasing this HT I researched
the Yaesu and Icom offerings, and to a lesser extent, Alinco.

lpvwwwtp@cencom.net wrote:

: about them as you felt. Secondly I got the price on the dual-band Kenwood HT
: (I think that thta means handheld) it was a rather steep $459 which he agreed
: was probably the best dual-band handheld. I poked further to find that the

I paid $429 for the low-power version (6.0V 600mAh NiCd included) on sale
at HRO. I think it's $439 now for the same radio.

: TH-79D has 5w transmit on 2 meter and less on 440Mhz. (which was apparently for

My instruction book specs 5W on both bands, with 9.6V or higher voltage input.
I've verified this output into a Diamond NR-2000 (tri-band) mobile antenna
with a Daiwa CN-465M SWR/power meter.

: safety reasons, it being a higher frequency and closer to microwaves) it had
: full 2 meter tx but only 438Mhz-450Mhz tx in 70 centimeter band. I then found

The radio is modifiable for TX+RX 136-174 and 410-470 (mine was, some radios
seem to mod to wider bandwidths). Aircraft AM receive 118-136 is in there too.
The mod is not easy though, involves removing a couple VERY small surface-mount
diodes.

I heard rumors of a keyboard mod sometime ago but nothing concrete has
come of it. Does anyone know of such a mod that actually works?

: that the FT-51R, Yaesu's competiton cost the same, but lacks cross-band
: repeating capabilities, and the easy-to-read dot-matrix display. The FT-51R

The dot matrix display is very easy to read. I like it a *lot*. The back
lighting isn't terribly bright though - the Yaesus seem to have better
backlighting of the display and keys (the Kenwood's keys are not backlit),
but in practice this hasn't turned out to be a problem.

: did, however, have a spectroscope which I guess gives you a graphic read-out of
: full band activity. I think the operator said that cross-band repeating let

Ya know, it's funny... I also own a TH-89 (Japanese). It is almost
identical to the TH-79, but is 430/1200 MHz, and it *does* have the
spectroscope display like the Yaesu and Alinco radios. Do I use this
function much though? Nope!

: the models more in my budget range (though if you feel the Kenwood to be worth
: the extra money, tell me). The Yaesu FT-50R is a tiny little dual-band (which

Yep! I'm happy with it. Packed with features. And quite compact.

: has tx. capabilities of full 2 meter and 430Mhz-450Mhz) plus {brand-new} that
: goes for around $329, the man said that this lacked the ease of programming
: that the Kenwood has and it lacked the cross-band repeating {or maybe all
: repeating capabilities altogether} Once programmed, however, this hold more
: memories and will operate just as well {or so he says}. The batteries come

I saw one at HRO and it's a handful! The salesperson said it didn't do
simultaneous reception or rx + tx (full duplex) like the TH-79 and other
more expensive HTs can. The FT-50 looks and claims to be quite rugged,
however.

: with them, but sold seperately will cost $90 for the Kenwood TH-79D and $50 for
: the Yaesu FT-50R {these are the high-power battery prices) The kenwood has a

BTW, you can get aftermarket batteries from Periphex and other mfrs.
The 6.0V 1200mAh long-life battery for the Kenwood goes for about $50.
(Kenwood brand of same battery is $90, same as 9.6V 600mAh hi-power you
mention). Also, this isn't a big deal, but the Kenwood rapid charger
is the least expensive I've seen for any of the mfrs. Mr. NiCd (see
Nuts 'n Volts magazine) has batteries and their own chargers for less too.

: standard BNC connector and the Yaesu an available, but not so common SCR (I
: think) connector. Your input is welcome! I'm leaning towards the FT-50R

It's an SMA connector. I think it has, or has the potential of,
lower loss than a BNC. For attaching a rubber duck though, I dunno if this
really makes much difference. I do have SMA connectors on some other
radios, and 1) they can be fragile, 2) they take more time to change
(owing to screw-on instead of snap-on), and 3) you will likely have to
use SMA-BNC and/or SMA-PL259 converters anyway, and see some signal loss.

My $.02

Cheers,

Dave KE6AJC

Why would anyone want an amateur HT to work in the FM broadcast band
anyway?

Although the ad is incorrect it was pointless int he first place.

Just my opinion

Nick

From: Chester Bowles <bowles@cmf.org>
Message-ID: <4na212$bei@news.monad.net>
Source record: 201388

Got the new HRO catalog in the mail yesterday. They had a full-page color ad about the new mobile in addition to the typical B/W picture in the Standard section. Of course, no price given, but there was a fair amount of detail plus a good picture.

As I recall, it was 35 watts out on 6 and 440. 45 watts on 2. Detachable head. Only two band "windows" but lots of options about how you display the various bands.

I must admit that I was VERY intrigued by the radio. Getting 6M in addition to 2/440 could be a lot of fun. Plus, according to the specs, a tri-plexer is built-in so you can only need one antenna (doesn't do you much good though since I don't think such an animal exists. I'd probably opt for an antenna switch to go back and forth between the 2/440 antenna and the 6M antenna.)

IMHO, Standard builds good although it's certainly not cheap. I'm sure this radio won't be an exception.

In my case, it's like a little general coverage scanner that also transmits. I also regularly listen to public service freqs, marine and air freqs, etc.

Have you tried replacing the WFM filter with a resistor?

Since, I don't have an FT50 schematic, I don't know if there is
another filter, located in an earlier IF, which limits the
bandwith, too.

Source record: 201394

Here the situation, I'm just starting in on this radio thing and I'm having a problem figuring out what is best. I started with a couple of 49 MHZ radio shat in pocket communicators so I could play paintball and talk to another member of my team at the same time. I quickly found out that the refs use the same frequency and that the rang and clearity wasn't that good. I nneded something that would work better since I didn't have time to play around with things while I was playing paintball. I also tryed to use these in the car since we travel in multiple cars a lot and I thought it would be nice to be able to talk to each other. At any rate this didn't work. I returned them and figured I would give a CB a shot. It started out really good, then I realized that the CB (a hand held one) would be great for paintball, but not very good for the car since it picked up every little electronic devise in my car, since I have a stereo well over $1000 and an alarm to guard it along with a radar detector to watch for police oh and I can't forget about the pager and cell phone. Anyway you get the point, I'm into electronics. So now I hear all about these HAM radios, and VHF. How far can they reach and what kinds are the best, how much do they cost, where can I get them, are there a lot of people using them? You get the idea, I have no clue about them. I know I need a licencse and that's about it. Some one has been a great help to me so far, any more help would be greatly appreciated. I am extreamly interested in what the benefits are off having the VHF as opposed to the CB. Well please get back to me, one of the more important things is cost and range. I want to creat a docking station for it for my home and for my pickup truck. I am very interested on how far people think they can go. Please email me at bprender@lynx.dac.neu.edu with any help. I don't read these all the time so I would probibly miss any resonse to this. Thanks for any help at all......

> John KD7AAT

Very simple John yours, was adjusted properly at the factory many
are not. When properly adjusted the HTX-202 has wonderful audio but
this is not always the case. The Radio Shack customer base may not be
technically adept enough to deal with a problem like this. The average
RS sales person certainly is not. Before flaming note I said average
not my Extra friend who work there part time. A non technical customer
coupled with a store staff who is taught to push the merchandise and
precious little else will not get these type of problems resolved.

As I recall John you have had your ticket for a couple of weeks now
perhaps there has not been enough time to find the warts on the RS
equipment. I also seem to recall a flame from you on this subject.
Do you work at a RS store perhaps? Inquiring minds want to know.

For the uninformed please explain how it will be used legally.
Perhaps outside of the US or as a laboratory frequency source?
Just limiting the power to 4 watts is not going to slop the hogs.
If you want to operate on 11 meters there is a lot of legal stuff
for a very few bucks. Operation Amateur equipment on CB is one of
the few areas still drawing enforcement from the FCC. Just my
opinion no flame intended.

2378. Tucker Electronics Radio Repair?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-14 00:00:00 UTC
From: Saad Mahaini <5606939@MCImail.com>
Message-ID: <4najlp$sc3@news.internetmci.com>
Source record: 201402

Last month, there was a thread on this news group about the radio repair shop at Tucker Electronics. All posting indicated dissatisfaction with Tucker's work quality, service response, and technicians lack of expertise. Tucker had my radio when I read these postings, so it was too late to reverse my terrible mistake of letting them service my radio. Well, I became another victim, and I paid the price.

I am extremely disappointed with Tucker Electronics radio repair services. The radio is currently at International Radio being serviced and aligned by the experts.

In case you are wondering about my bad experience with Tucker Electronics, I included my recent email to them in this posting. I am doing this as a curtesy advise to all of my fellow hams.

Bottom line, do not even consider Tucker Electronics for your radio repair. Just send it to the experts somewhere else.

Regards, Saad KB6VIR/5

Subject: Radio Repair Department - Customer Dissatisfaction
Message-Id: 94960501222449/0005606939PL1EM

Dear sir,

This is to inform you of my great dissatisfaction with your radio repair services. The following is a summary of my problem:

Few weeks ago, my kenwood TS930SAT quit transmitting. I inspected the radio myself and determined that the problem was in the finals (PA) board. I replaced one power driver transistor and couple resistors, that were burnt. The board still did not work, so I decided to take it to the local Kenwood authorized repair shop (the experts) at Tucker electronics.

I called your technician about one week, after I delivered the radio to your service department. I was informed that your service department can not repair the radio, and I was asked to pick it up. Along with the radio, your technician give me a small plastic bag with various components (transistors, resistors, screws, spacers, etc.), that he

removed from my radio. Worst of all, I had to pay Tucker Electronics $43+ for all of these great services.

In plain English; "Tucker Electronics refused to fix my radio after they removed a bunch of components from the board, put them in a plastic bag, put the radio back together, asked me to pick it up, and then charged me $43".

Your technician indicated that the board had severe burns and damages. I inspected the board afterwards, and only found a very minor black spot (smoke stained area) on the top side of the board. This spot is right below a removed resistor next to one of the driver transistors. Similarly, he reported the presence of white corrosion on the module, which is in fact just heat sink white silicon not corrosion. Also, I noticed that the board was slightly damaged during your technician's attempt to repair it. A PCB eyelet (feedthru) was broken off, which appeared to be a result of high soldering heat applied to it.

Bottom line, I was extremely disappointed with the service that I received from your repair shop. I am now convinced that your technicians are not professionals nor experts in the radio repair field.

Regards, Saad Mahaini KB6VIR/5

2379. FS: Yaesu FRG-100 for quick & cheap sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-14 00:00:00 UTC
From: Dave Campbell <campy@falcon.cc.ukans.edu>
Message-ID: <1996May14.144933.119858@kuhub.cc.ukans.edu>
Source record: 201403

I have a Yaesu FRG-100 that is currently sitting in a box doing
nothing. I've dropped out of my shortwave DXing in favor of schoolwork,
and would like to sell this radio at a fair price.
It includes all of the original accessories and is in showroom
condition. I'm also including the French made Keypad which allows control
of power on/off, freq selection and memory selection. It has worked very
well for me and I never had any complaints (other than lack of time to
pursue it!). I'm also including the 9th Edition of the Confidential
Freqeuncy list and a copy of the 1996 Passport to World Band Radio.
I used this radio with a Radio Shack multiband antenna in my attic,
and would be willing to throw that in the box also, with 50 feet of RG-58.
I'm asking US$450 for everything. I'd say the price is negotiable,
as I need to sell, but I can't afford to lose too much, as school loans
only go so far! I've been trying to sell for a while now, so any serious
offers will be acted upon _immeadeately_.

Thanks,

Dave

This discussion has failed to address one critical area of safety. In fact, it's a hazard that can be made worse by the grounding requirements of electrical codes. Those codes were written by engineers who work in the field of AC power. In that field, there's a general assumption that power is being supplied to equipment that is properly and *permanently* installed. The codes also seem to assume that equipment will either have an insulated chassis that prevents contact by the user, or that it will have a three-wire line cord.

Much ham equipment doesn't fall into either category. In addition, it's not a permanent fixture. More than likely, it will be connected and disconnected by the user much more frequenctly than any home appliance the power engineers based their recommendations on.

The hazard I'm speaking of results when non-insulated equipment with a two-wire line cord is used in the proximity of, or is connected or disconnected from, the electrical ground of the home. Components inside the equipment create AC leakage to the chassis that is often more than sufficient to arrest the heart. If the user makes contact with the chassis of ungrounded equipment simultaneous with earth or electrical ground, the leakage current flows through the body. Any ham who has disconnected his two-wire equipment from ground (or from other equipment), either by disconnecting the ground wire or unscrewing a PL-259, has probably been shocked by this current. I can't quote any cases where death has resulted, but the only thing standing in the way of such a fatality is skin resistance.

Considering that the connectors and ground wires sometimes work loose (or at best can't be relied on given the gravity of the hazard), the only real solutions are A) always remove *all* AC plugs from the wall before attaching or removing *any* connection to *any* piece of equipment and B) ground each individual piece of equipment redundantly, that is, with more than one ground wire.

7. How about a standard, separate low level (10-20dbm) transverter output?

8. Of course also an open collector output, grounded for xmit for transverter PTT switching.

9. How about the ability to dial in a transverter offset for the displayed freq (like the TS850 I believe)? This should be a firmware only enhancement to most radios.

Is there any info on how to date Vibroplex Morse keyers? I have two I believe
are old both have grey basses one is a paddle type its serial number is 126433
the other is a button type and it says Zephyre on the bottom.
Thanks Greg

2387. Manual wanted : HP 5240A frequency meter

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-14 00:00:00 UTC
From: adrian@fangorn.demon.co.uk
Message-ID: <DrEwCF.3Av@fangorn.demon.co.uk>
Source record: 201411
Cross-posted to: sci.electronics.repair,uk.radio.amateur,rec.radio.amateur.equipment

I'm looking for a service/operating manual for an HP 5240A frequency meter. It's a 12GHz meter that dates back to the late '60s - this example is still in reasonable condition and suffering from what I hope is a simple fault (the gate isn't triggered by the sample rate timer - it just triggers occasionally when switches are moved).

If anyone (including dealers) has a manual, I'd be happy to pay reasonable shipping and photocopying costs. Note that I've already tried HP and the main UK surplus dealers without success. HP were helpful and can send me a few circuit details but no longer have copies of the manual for sale (even on microfilm) - it appears that the only remaining copy is in the archive at the Santa Clara plant.

I'd also appreciate help identifying some HP-numbered parts, probably TTL, in this instrument. They're :

1820-0074
1820-0063
1820-0093
1820-0116

Thanks for any help,

-adrian

2388. Help... How do I do the FT-530 mod???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-15 00:00:00 UTC
From: kc8dml@aol.com
Message-ID: <4ndeh5$pp1@newsbf02.news.aol.com>
Source record: 201112

I own a FT-530 and have heard many things about the modifications for it. I read numerous files that said to unsolder Jumper 13 for extended TX and RX. Or Jumper 15 for just extended RX. Is this correct??? One spot said I had to unsolder them both..... Is it true that it will have 800 RX capabilities???

Any help would be appreciated..... Just email me or if you live in the Cleveland Area, give me a call.

I looked at another one at HRO for around $17 (not sure of the brand) and
it had a smaller magnet. I chose to Larsen because the magnet is powerful
enough to keep the base from sliding across my roof at freeway speeds
(plus some :>).

I have looked into kits. See the June, 1996 issue of QST for reviews
on 6 QRP transceivers. I've also spent several hundred hours building
kits and homebrewing everything from code practice oscillators to
a 25 inch color tv, and a lot in between. Read the QST reviews you
were too busy to look up, too.

None of which is relevent. I'd sure like to hear from someone who
actually owns and uses one of the MFJ-90xx rigs and would share
their experiences.

I have an on-glass larsen 150mhz antenna that was installes
in Feb of 87 on my Supra and is still there. This car has lived
all it's life in the sun- Caribbean and So Cal. Antenna stays on
at highway +++ speeds (in excess 100 mph). Professional driver on I-5,
do not try this at home.
Only problem is that the INTERIOR on-glass mt needs to be remounted 3
times in the last 9 years -prob due to heat. That is much better
than my cell antenna. There are remount kits out for
about $10.

You do need to remove the tint as there is metal that interferes with
the signal, and may have adhesion problems on the film.

Larsen is great. We just installed 2 roofmounts on my unit and get
amazing results using talkaround.

Hope this helps

Matt

While reading article <5e7cc$11271c.2ce@NEWS>, I noticed that
mouer@mail.ameritel.net (Dan Mouer) said the following:
>I have a few questions about the Kulglass Antennas (Larsen) sold by Ham Radio
>Outlet. I am specifically interested in either the KG144PL (2m), or
>theKG2/70PL (2m/70cm).
>
>1. Are glass mount antennas any good? I am using an HTX-202.

Yes, they work quite well. I have the Larson KG 2/70.

>2. Does anyone have any experience with these two antennas?

As I said, I have the Larsen. It works pretty well for my application, one
in which I didn't want to drill a hole, I don't really have a decent lid of
any type for a lid mount type antenna, and I got sick of dealing with the
mag mount.

However, as with all such technologies, there is a trade-off. For various
reasons, the performance of the glass mount isn't quite as good as is my
Larson NMO mag mount, probably because of the ground plane the mag mount has
to play with. Note that out of band performance suffers with the glass mount
as well; for example, my local NWS station at 162.475 MHz comes in "full
strength" on the bar graph of my rig when I use the mag mount, but at only
about 50% of that with the glass mount. Note that in-band frequencies show
no such discrepancies.

>3. Is the SWR a problem with this type of antenna?

Not really, but let me warn you that at least with the antenna I had the SWR
was too high because Larsen had apparently cut mine too short. However, I
called them and they were very nice and sent me a custom rod that I cut to
size and brought the SWR down significantly.

With the original rod I had readings of 2.5:1 or greater in some places on
the 2m band; now both 2m and 70cm stay below 1.7:1 or so throughout both bands.

I'd suggest investing in or borrowing a good SWR meter. You'd probably want
to use one to double check you hadn't accidentally kinked or broken the coax
during installation anyway.

>4. Do these things really stay glued onto the glass at 'highway speeds'?

Yes. I've been up to 80 MPH with no problems, though the antenna does sing
quite a bit at higher speeds/higher wind speeds.

But, MAKE SURE TO FOLLOW THE DIRECTIONS. Clean the glass throughly, make sure
you use the pre-adhesive they give you, and make sure the temperature of the

window is in the recommended range. Forget any of these steps and all bets are off. The recommended bead of silicone sealant around the seam between the base of the antenna and the glass is highly recommended as well.

>5. The window I would place it on has some tint ('94 Toyota truck w/ extend
> cab), would this be a problem?

Tint isn't a problem unless it's metallic or it's that raised textured kind often found at the top of rear windows. If the surface is smooth and you can receive/xmit through it (check with an HT) you should be fine.

Adrian. I found only two of the parts you asked for:
1820-0074 is a 7454
1820-0063 is a 7451
The other two are so old that my crossfreference does not show them.
There is a chance that I can find the other two later on. Cliff W6HDO

Ron,

You really need the manual. Basically its set the inductance and
capacitance to the place where you get the most meter reading
(current) on each band.

Look for a bad connector on the PC board. Use a contact enhancer on all the connectors. (Not a contact cleaner, but something that actually changes the conductivity of a contact.) I forget what it is called but its something like stabilate.

No I don't work at/for Radio Shack. I don't flame. I might have
remarked about the choice of a persons words when they were uncalled
for. I've used my 202 and 212 for many hours now and find them BOTH
to be very excellent radios. If a person has a problem with a radio
from anyplace, take it back, have it fixed and quit your bitching.

Cut the R151 on CDJ-1143 CONTROL board.

This is the 4th resister mounted besides switch S1. The 1st resister
R154 is the one to enable TX-mute signal (which usually do not have to
activate) and there is a description in the manual how to enable this
one. Do the same to R151, which is connected to IC1 pin 41.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

>

I've had a KG 2/70 on my 94 Integra GS-R for a couple of years. It works about as well as the NMO 2/70 I had on my previous vehicle. The peformance on UHF is acceptable, but a 2 meter 5/8 wave mag mout will kick its butt.

It appears that Larsen changed the design somewhere along the run of the KG 2/70. The newer antenna is slightly shorter, and from what I understand the outside coupler has been redesigned so there aren't any internal adjustments. A friend of mine also has an Integra and he has the new style mounted in the same fashion I have mine, using the same radio we've found that between the old desgin works a lot better on 2 meters, however UHF seems to be about the same.

With my antenna the SWR on 2 meters is about 2.5:1 throughout the entire band, on UHF it does actually drop below 1.5:1.

I drive "briskly", and the antenna stays on just fine. Just make sure that you clean the glass without leaving any residue and attach the antenna to warm glass.

Water can get inside the outside couple. When that happens it works about as well as a Cantenna. Then you'll have to take it apart, dry it out, and put it back together with RTV.

All in all, the antenna works ok for what it is, but I would only use one as a last resort. The next time I buy a car I'm going to consider my antenna options before I go on a test drive.

2421. Alinco DR-590 info?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-15 00:00:00 UTC
From: vk2gjt@netwit.net.au
Message-ID: <4ncjor$mq3@klf.netconnect.com.au>
Source record: 201188

Hello all,

Some time ago I vaguely recall information regarding modifications
that can be done to an Alinco DR-590 to correct the temperature
sensitive squelch setup within the radio. Does anyone know anything
about this?

Also, same radio. I have noted that after a time of operation the
received signal, particularly on 2m tends to drop away somewhat.
Still don't know if there is a problem with the local repeater or if
it is the radio. Does anyone have any idea with that?

Finally, does the Alinco company in the USA have an e-mail address or
a web page?

Thanks for tolerating all my questions.

Cheers,

: KD6ISK
800 MHz, conventional and Type I trunking, maybe type II if the right
firmware is installed. So, no to ham VHF and UHF work, it may be able to
do some 900 MHz, but I think it is outside of the specifications. You may
be able to get $100 for them, if someone needs the unit...

Have fun!

I cannot find my handbook. Could someone please give me the formulae
for a simple notch filter given a known impedence, notch frequencies (lo
& hi), and required attenuation for the stop band? I appreciate it.
Thank you.

2428. 2M Amps without relays

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-15 00:00:00 UTC
From: rma@mtgzcs5.mt.att.com
Message-ID: <4ncqao$3m1@nntpa.cb.att.com>
Source record: 201195

I have an old trusty Mirage B-108. It has been an
excellent piece of equipment for 2M FM, SSB, and CW.

Now that I've gotten into packet, the B-108's t/r
switching, which is relay based, is irritating.
Ka-chunk! Ka-chunk! every couple of seconds.

I also have a Ramsey PA-10 which uses PIN diode
switching, and I -love- the silence in comparison
to the B-108. The downside is that the B-108
delivers a lot more output, and has a better
preamp.

Q1: Does the current Mirage product line still
use t/r relays?

Q2: Can anyone recommend a medium power amp that
uses solid-state switching? I'm looking for an
amp in the 2W in --> 100W out category.

Q3: Does anybody have any comments about the new
Tucker 2M amps, especially the higher power (100W)
one? Relays?

Thanks much, and 73s!

Rich

Mt FT-50 has great receive audio. In fact, it has the best receive audio of any amateur band handheld I have ever owned. I also listen to public safety traffic on high band, 460 MHz, and 800 MHz, and the audio sounds great in these ranges as well. There does not appear to be any degradation in audio quality when I use it to listen to public safety and other transmissions outside the amateur bands.

2431. Hammarlund HF-30-X

From: "R. Troy Monaghen" <troy@mcs.net>
Message-ID: <3199DC88.4A4@mcs.net>
Source record: 201201

I have an FT51 and I was wondering if enabling/disabling the
extended receive has any affect on intermod rejection. There
is an area that I pass through as I drive to work where I seem
to pick up alot of intermod. I tried turning off the exteneded
receive mode to see if I noticed a difference and I did not really
notice any difference... but one quick test is hardly conclusive.

Anyone have any information or experiences with this?

Thanks in advance for any replies.

Have not heard of a 1000kc filter... I have a 1800kc in my TR7
and find it usefull for tuning cw..Cuts the noise...and is there
when you need it for SSB. Be sure to make use of the PBT..on any
filter...to move the CW note or SSB pitch where you like it or
can copy the best...

This makes me wonder if there's a particular range of impedances
(below 50 ohms) that could cause heat damage to the finals, but
without tripping the supply. Also, will these rigs transmit into
an open without damage?

While I don't have a Drake, my TenTec has 2400, 1800, and 500 Hz filters. I guess you might need something more narrow if you are running big pile-ups and want to tune the rabble out. But for the casual user and the casual contester, I think 500 is about as narrow as you would need to go. Personally, I've never wished for anything more narrow.

As to SSB, I occasionally use the 1800 filter when conditions are poor. But the audio quality does, indeed, suffer. 2400 is MUCH better. I can't image that you would be happy with 1000 for voice at all. I tend to use the 1800 to "listen around" on CW and to listen for answers when I call CQ. If there's no adjacent interference, I leave the 1800 filter in place. I only switch to the 500 if conditions are bad or if I need to tune out a nearby station.

For my money, if I only had two filters, I would opt for a 2400 and a 500/600.

the radio shack HT202 should still be on sale for under $200. it hears as well, or better than, anything i have.

>My biggest question is, what band should I go for? I want to start
>using phone, and I was thinking either 2 meter or 1.25 meter

1.25 really isn't a choice. 2m can be crowded in some parts of the country. 70cm tends to be sparsely populated in some areas, or the repeaters are generally closed in places like l.a.

you really need to find some local hams, and see what they are doing. ignoring some of the uhf/vhf stuff you may eventually get into, think in terms of a 50 to 100 mile radius as your operating area.

Source record: 201209

Hello,
I am currently using a Drake TR7, and am interested in opinions on filters for CW use. I have a 300Hz CW filter that I find to be useful, but very narrow, and am wondering about a filter for more casual CW use. I have room for one more filter in the rig, and am wondering which would be the best choice between a 500Hz filter or a 1000Hz filter. I understand that the 1000Hz filter is maximized for RTTY, but I am wondering whether it might be okay for casual CW and very sharp SSB. In this regard it would be quite versatile, offering an intermediate filter between the 300Hz and 2100Hz SSB filter. Or, would the 1000Hz be too wide for CW and too narrow for sharp SSB? In this case perhaps the 500Hz would be the best choice. Or would it not offer much advantage over the 300Hz? I would appreciate any feedback from TR7 owners who have familiarity with these filters, or any opinions from other rig users who have used similar filters.
Thanks,
Chris VE6RDC

>reliability problems. Any intermod or other problems? thanks..gus
>wa6wbc
>

No problems because of the mic, and I like the fact that you can use a seperate speaker/mic and still detach the display for a 'remoteable HT'. It's a good feature because the remote display allows for almost heads-up type of operation in a car.

Plus the backlighting is selectable for the display/spkr-mic and keypad, or just the display/spkr-mic. I haven't experienced any intermod as of yet, although it hasn't gone into the city with me yet. Scanning speed is alot quicker than my IC-P4AT and TM-742, and is an improvement over the W21AT that I owned last year.

If your're used to HT's with a seperate volume and squelch knob for each band, then the W31 or Z1A are going to seem awkward at first. The center of each of the 2 knobs is a tuning dial for it's respective band, while the outside ring is the squelch control for that band as well. To change volume you have to press the volume button and then use the tuning knob to set the desired band.
What helps is that you can have a pre-set volume in each band (using the SET mode) and there's also a mute function that mutes both bands.
Although if you're used to the Kenwood 79A(d), then you should be used to this awkward way of controlling the bands.

The keys are bigger than the norm and are spaced well, especially for Icom, and the display and keypad backlighting are more than generous. The US version comes with the PL decoder option installed, as well as the BP-180, a 7.2v 600ma pack (which gives you more power output than the 2 4.8v optional packs). Icom also gived you the really cool looking duckie, it's nearly a foot long, and I wouldn't be surprised if it's the same one that they used on the good ole' W2A model. It provides better gain on UHF then my set of Smiley's.

The drawback on getting the BP 180 is that it requires the soft case that only fits 2 of the 5 batteries that you can use on the Z1, so if you wanted to get the 950ma long life pack, then you'd need the second case. (at least if you're like me and have to have a case to fit every radio with every battery).
One drawback with seperating the front panel from the rig, is that the front panel/speaker mic is now not protected by a case. Icom should have realized this and come out with a case for the display part when used seperate from the rig.

I like the alpha-numeric display, but it's too bad that you have to sacrifice displaying channel numbers for channel names, they're mutually exclusive.

All-in-all, it's a very solid performer, although when you use the tuning dials, the click almost makes the case sound like it's hollow, or made of some flimsy plastic, but I can assure you that it's not really the case! (No puns intended!)

I like my Z1A, especially with Icom's $100 rebate one can only wonder why someone would pay an additional $100 for the W31 (or any other HT for that matter).
Good luck!

Steve W.

Thanks, Dick.

Have you read the reviews of the CAT in the DEC 1995 QST? If so,
how did their experience compare with yours?

Did you use the CAT to build your speed up for an upgrade? That's
sort of what I am hoping to do and why I started this thread.

>don't know if it has a tuner, etc.

I'm not going to estimate a price, but here is what to look for:

1) Does it have the built in tuner? This is very important.
2) Which filters does it have? The 850 can manage up to 3 filters.
They make a huge difference on the digital modes and CW, the 1.8Khz is nice
for SSB.
3) The TCXO is nice for the digital modes.

There are other goodies, but these are some of the critical ones. FWIW, the
850 still approaches being as good a rig as money can buy. It lacks
the fancy inboard DSP of the 870, or the dual receive of the 950SDX, but
otherwise, it is unsurpassed. These features are things many can live
without. I love my 850 and am not about to upgrade based on what is
presently out there. Now when the KW 890 comes out in about 5 years,
well....!

As you can perhaps tell, I think that the 850 is a GREAT radio!!

Another source of RFI from a common appliance is the "Touch Switch" type lamp (the kind that you touch the base to turn the lamp on and off). The RFI appears in bands about 50KHz wide and spaced about 200KHz apart throughout the HF bands. It has a raspy, buzzing sound and occurs when the lamp is plugged in even when the lamp is switched off. I had RFI from one belonging to a neighbor several houses away. The signal is coupled to and radiates from the power lines so it can be a problem for quite a distance. Bob K4LXA

I'm looking for a wireless phone which has a long range reach, to be...

The AT&T Digital Cordless 9300 phone costs $210 at Sears and uses digital spread spectrum transmission. With the base in my house, I can use the phone not only in the garage, but also in a neighbor's house way down the street (about 100 yards away). That's about the extent of its range. Not bad. I guess the older 9100 model is digital but does not use spread spectrum, and does not have the same range.

Anyone know of other cordless phone models that use spread spectrum? How about the possibility of using such equipment under amateur service rules, with amplifiers, e.g. for computer networking? (I guess the WaveLAN 2Mbps product also uses spread spectrum in either the 900MHz or 2GHz bands depending on the model.) A friend said something about differences in Part 15 and Part 97 with respect to spread spectrum, but I don't know the details yet.

One hint passed along from one of Larsen's engineers is to thoroughly
scrub the area to which the antenna will be installed with Bon Ami and
a wet sponge. This scrubs off any Rain-X-type material which the
factory may have applied. I've found that once the area has been
scrubbed enough so that the water no longer beads on the application
area but films across it, the antenna will stay installed.

Just be sure to wash the Bon Ami residue off the rest of your car once you're done!

If RCA no longer supplies the parts (which I have no problem finding
this true 25 - 30 years after manufacturers date) FOX will definitely
not have the parts either. There are several electronics places on

the web that advertize availability of obsolete or hard to find parts. You might try them, but, you chances are probably pretty slim. I see there is a NG called rec.antique.radio+phono on my server. If your server carries them. maybe someone there could suggest a source for the parts you are seeking.

I have had a 2M Larsen glass mount on my vehicle for a few years. After about 5 years the glue loosened up and the thing fell off. Fortunately I drive a pickup and it fell into the bed. I was easily able to remount it after going to HRO and picking up a remount kit. (Glue mainly). In spite of this occurance I would say that I am happy with it. The match is good and it gets out as well as any other 5/8 wave I have used. I do notice that it has a tendancy to rotate in its mount when it hits a tree branch but I figure that is good strain relief. I unscrews easily it desired and the whip could easily be replaced. I don't know about tinted windows. I understand that old glass is better to mount it on because it has microscopic pits that the glue will adhere to. Anyway. that is my experience. rong@slip.net - KB6GK

As I have mentioned on this group, I have built the "Any Band" Receiver for 40 meters and it has been worth every bit of the modest price. The fun of building is back. I ordered the 9 band SW receiver and a couple of other kits from them. They are yet to arrive. I ordered another any band receiver just to put it on 80 meters. For 29.00 it is dirt cheap to have a modest receiver available. I built my own case for the first one but after checking the catalogue I ordered several cases from them since they are practically free compared to the work of building my own .(All under 10.00, some as low as 4.20.) I agree, Tec Ten has a winner in this line of low cost kits. I was tempted to get the 2 meter rig but I can't use another one. The only thing it lacks is scanning, but I could live without it for the price. rong@slip.net - KB6GK

I've had a Larsen 2m glass mount since 1989. The antenna works fine and the adhesive has been great. When I got a new car I removed the antenna (much work with acetone, a putty knive and lots of elbow grease) and wrote to Larsen about how to re-install the antenna. They sent me a re-installation kit gratis - contained the glass cleaner, the double-sided adhesive and isntructions.

Follow the instructions and make sure the mounting surface is clean and dry. I've never had a problem with the adhesive coming loose.

73, es cul
Jim, WG1Y

p.s. I have no connection with Larsen. They just seem to be a good company.

If they use ACC controllers then DTMF tones can be repeated. The default prefix to pass tones is # . If it has been changed ask the owners what the code is.

This seems to be one of the best HT's out there (especially when you
consider the $100 rebate from ICOM). The remote mic is very
reliable...as reliable as when it's not remote... Very little intermod
(considering it's an HT)

Nice rig -- and the mods are available to make it even more capable...

I have a Realistic/Tandy HTX-202 2M transceiver and I have a big problem with it: When I was using the radio,
tuning up a PA, the final transistor said "goodbye". The PA transistor is a Motorola SRFH1900. It doesn't
seem to exist in Norway. Have already tried to get the transistor from Tandy, but they will not send it to
Norway, because the radio only was for sale in the States. So if anybody know where to get this transistor or
any other transistor that would work, please let me know.

Thanks in advance

I personally like the CAT Ultimate Morse Tutor with the 16-character LCD display. The ability to have it play 16 random characters and then check your copy against the display is worth the price of admission alone. It is only the size of a pack of cigarettes and with the quite adequate built-in speaker or an earphone, you can use it anywhere and any time. It has its flaws, but IMHO it is the best for someone looking for a practical trainer.

Standard disclaimers apply. YMMV.

Hi Dan

Unfortunately, many others have shared your experience! The problem is that Kenwood has refused to appreciate the fact that their customers and potential customers deserve to be unambiguously informed as to just what one should expect from their "DSP" products.

Up to now (or at least prior to the appearance of the TS-870), DSP for Kenwood has meant something very different from what the majority of amateurs have come to expect! Most expect DSP to perform some sort of "magic" on noises and heterodynes. But Kenwood's DSP (as it first appeared on the TS-950SD) had as its objective the generation of waveforms for SSB (and CW rise/decay profiles) through mathematical processes very different from the generally accepted "guillotine" approach using analog filters. The result being a potential for greater transmitted audio bandwidth (if desired), reduced phase distortion across the transmitted bandwidth, and absolutely phenomenal alternate sideband rejection (on the order of 70 to 80 dB!).

The DSP-100 achieves these objectives. But if one is looking for noise or heterodyne reduction, this is not the unit to have! The justification for using the DSP-100 is if the operator is primarily interested in transmitting a signal of considerably greater quality than is generally possible with conventional analog filtering. This is matched on the receive side as well... but in order to appreciate it, the incoming signal has to be of commensurate quality!

The difference between a conventionally generated SSB signal and a signal generated by the DSP (assuming the bandwidth is not set extremely narrow) is very obvious to the listener, provided the receiving equipment is up to the challenge! Regrettably, too few have such receiving equipment... and for those who do, many do not take advantage of it.

So, it is not at all surprising that so many have failed to perceive the magic of DSP as first introduced in commercial amateur products by Kenwood. First, they are looking for something unintended (i.e., noise and heterodyne magic). And, secondly, the receiving equipment may not be up to the task.

With the advent of the TS-870S Kenwood has begun to incorporate some of the "expected" attributes of DSP along with those that are there strictly to enhance quality.

A final caution... If the Kenwood DSP is used to achieve a quality signal, it should be understood that an appropriate microphone is necessary (not one with strident audio) and it should be appreciated that if the speech processor is turned on, virtually all of the benefits of the DSP are out the window!

Regards,
Keith (KS9C)

Your HTX-202 and HTX-212 are far from a statistical sample. When the HTX-202 first came out it was famous for low audio. This who thing started when some one asked for help with low audio on a HTX-202 he got blown off with a comment to turn the mike around. This problem is well known not as common as it once was but well known to be sure. My point was the deviation can be adjusted. Some helpful sould has posted instructions on how to do this. If you lived in this area you would bot be so pleased with the HTX-212 as the local long range repeater is on 145.19 a bit of a nusance with the HTX-212.

I was right I did remember your call you sent me a nasty email after my first post on this subject perhaps technically not a flame as it was private email. Exactly how many hours have you operated these two pieces at the time of your post your call had only been active for 300 or so hours total?

Conversion of single channel FM radios to the 6 meter band

There have been many requests for information in conversion of some of the Radio Shack and Maxon 49Mhz FM radios to 6 meters. I hope to let others know that it can be done to certain radios quite easily, while to convert others may not be worth the effort. I have converted one Radio Shack TRC-505 and two Radio Shack TRC-509's to 52.525 Mhz by re-rocking and tune up.
From what I have learned I will pass on to you to help you in determining if you have a radio that is convertible and a general overview in how to do it.
In determining the radio. It is best that you consider only the single channel FM radios that are available from Maxon and Radio Shack and a few others. These radios will either be the walkie/talkie type or the headset type. These radios will have 3 crystals inside. A transmit crystal in the 16.61-16.63 range a receive crystal in the 39.13-39.19 range and a 10.245 Mhz crystal.
Radios that are from Radio Shack and have the name "Archer" on them may be a AM radio and are designed for the kiddies to bang around. These radios only have one crystal in them (usually 49.860 Mhz and a TRF receiver in them. These radios are not convertible for 6 meter FM. If you have a radio that you are not sure if it's AM or FM, get a scanner and listen to it's transmission. If it has a good quality to the audio then it is FM. If the audio is low and scratchy sounding then it is probably AM. The kiddy radios also do not have usually squelch and so there is continous white noise out of the speaker. If you still are not sure, open it up and count the crystals.
The 5 channel units that have come on the market recently are not good conversion items either. Their chips are designed around cordless phones and although they can be moved into 6 meters by changing the clock crystal, they do not fall on the 6 meter FM channels. They are not worth your time or effort to convert unless you can reprogram a chip to cover the specific frequencies that you need.
Now that you have eliminated the duds from the bunch, I will say some things that you might want to consider before starting a conversion these radios. They were designed with part 15 in mind. They only put out around 40 mw or.04 watt and the antenna system is made to be somewhat range restricted. If you convert one to 6 meters you will still only have 1/4 mile range tops if you do nothing to that dinky antenna. On a decent 1/4 wave antenna at a decent height of 30 feet you can expect around 3 to

4 miles range. These radios would make a excellent low power base radio if you place a connector on them or as a exciter for a home brew amp but then you are tied to a coax at the least. I have not found a good antenna for these radios that will fit in the original design.
Their receivers are ok but are prone to intermod. I have picked up a local 50kw FM broadcast station on mine. This is due to a lack of a front end on these units. Another thing you might consider is to instal a small pot for setting squelch. This mod I want to do since the fixed resistor squelch is set somewhat high on the units that I have converted.
Now if all I have said so far has not deterred you from conversion then go for it. You can get schematics for Radio Shack units if you give them the model number. For the TRC-509 it runs around $15 and you will have to order it. It is worth it. The schematic from the TRC-505 was included on the owners manual and it is so tiny that I cannot read the resistor values even with a magnifying glass (the printing resolution is poor at this level and they should have taken two pages for the drawing). For Maxon and other units you might need to contact the manufacturer directly for schematics.
Recommended equipment: General coverage receiver, frequency counter, scope with at least a 50Mhz bandwidth and signal generator that covers the 6 meter band, FM modulation preferred. If you do not have the signal generator a low level signal can be generated from a nearby radio until the first stage has been tuned, then if you have a programmable scanner you can use the IF to provide a low,low signal level for fine tuning.
Confirm the radio's specs prior to conversion. Check receiver sensitivity, transmitter output (on the scope)or miliwatt meter (most cb wattmeters wont detect the low level output these units have even on the 10 watt scale).
Crystal information:
Transmitter FO = Fundamental X 3 (F0= frequency of operation)

Receiver FO - 10.7 MHZ = Fundamental

Example: transmitter and receiver on 49.830 Mhz

Transmitter 49.830/3 = 16.61 Mhz
Receiver 49.830 - 10.7 = 39.13 MHZ
Confirm operation of the crystal fundamentals using these formulas to agree with your radio. Use a general coverage radio and a scanner to find the crystal carriers(Remember the transmit crystal will not be in operation unless the transmitter is keyed).
I used a 30 pf load and 25 degree temp celsius in ordering these crystals. I used Jan Crystals as my supplier. No mater who you use let the crystal company know what you are installing these crystals in. They may have information vital to making these crystals work. Use HC-18 style crystals with wire leads. If you

are modifying the ht radio you will have to lay the transmit crystal on it's side to allow it to work with the case on (the top of the crystal hits the speaker, the receive crystal is ok to instal upright). Since the new crystals do not have plastic on them, use some sort of insulation material to keep from shorting out the upright resistors adjacent to the crystal such as electrical tape around the crystal body. In the TRC-505 a smaller crystal can was used for the transmitter but in the TRC-509 they used a HC18 style and laid it on it's side already. The headset type should not have this problem but check it out prior to ordering.

Start with the transmitter. Use the general coverage receiver to determine crystal fundamental operation. Frequency accuracy can be set later. Use your scope with a 10:1 probe on the antenna output lead, key the radio and tune the first and second coils for maximum output on the scope. Then place probe on tip of antenna and tune antenna for maximum. If the antenna is telescopic, extend all the way. Re tune the entire transmitter stages again, for maximum output. Now set the crystal frequency with the coil next to the crystal and deviation pot(it is labeled L7 on the TRC-505 and with the transmitter fully tuned at this point it should be readable on a frequency counter. You might also want to drip a little wax down in this coil once tuned. Wax is better than coil paint because you can always melt the wax later and re-adjust, with coil paint you break the coil.

The receiver is a little tricker. First prepare a small insulated wire, stripping both ends. You will have to attach this wire to the demodulated output of the receiver IC. In the TRC-505 it uses a MC3357. Solder this wire to the demodulated output on pin 10 and clip your scope lead to this wire, again a 10:1 probe and your scope on AC, internal trigger with your ground clip on one of the metal coil cans. You will be looking at a display of white noise on the scope and the goal of this is that you will be looking to minimize this white noise as you tune the receiver up to the signal generator. As you tune in the generator and the noise is reduced to quieting, you need to reduce the amount of rf to the receiver, keeping just enough noise on the scope to determine your progress. If you have a audio tracer it can be used on this point as well, listening for a reduction in white noise. Instal the receive crystal and check for operation on a scanner listening for a carrier (the crystal will be weak so a frequency counter probably is not useable so that is why you need the scanner). Tune the fundamental in on the scanner (example for radios receiving on 52.525Mhz-10.7Mhz= 41.825 fundamental. Adjust the receive netting crystal for maximum quieting on the scanner. On the TRC-505 this coil is L4 and is located on lower left of the board (it is the coil closest to the receive crystal you installed).

Apply a signal with no modulation to the antenna input. Apply just enough to cause the noise level to drop. Adjust the coil

between the rf and 1st mixer stage (L2 on the TRC-505) and work your way back from this stage to the 1st mixer crystal (L4 on TRC-505) and repeat. There are really only two stages that you need to tune but you will have to repeat tuneup several times, each time reducing the level of the signal generator to leave at least a little bit of noise on the scope. You should be able to get the receiver down to around .5uv or less.
Once you get the receiver tuned to this point turn on a tone from your signal generator and set deviation to about 5 khz. Adjust the quad coil for maximum audio. In the TRC-505 this is L3 and is located near the demodulator chip and the 455 khz ceramic filter. If you do not have a frequency generator you can adjust this coil by fully deviating a radio on frequency by a long helloooo or other favorite fully deviation tricks, watching your scope for maximum signal level. Now that you have done this your receiver is tuned. Remove the wire from the demodulator Ic and apply a drop of candle wax to the receiver netting coil. Re assemble the unit making sure that no wires are pinched and the transmit crystal clears the speaker and does not crush components in the ht version. You have now completed your conversion.
This article gives a rough guide on how to do a conversion to one of these units and hopefully your conversion will be a smooth one. I have tried to keep this as broad as possible to cover the different versions of radios out there and the amount of equipment and skill each person has in doing the conversion.
If anyone has experimented with improvements to the antenna system with either the hand held or hands free unit or has built a amplifier to bring these units up in power, let me know.
If anyone has questions regarding conversion, drop me a line and I will try and help. Much of my information that I have here is limited. Good luck on your conversion.

I am not surprised to see this reply from Dale. AEA has always been HORIBLE when dealing with its customers! I sold ALL of my AEA equipment and now own Kantronics due to their lack of customer relations. Even if the AEA analizer was better, I would NOT buy it! Why should I, I would only get the "accuracy" of a $400.00 instrument. I can get that from an MFJ at HALF the price. AEA is a sad company...its really too bad.

2496. How to Optimize Quads?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-17 00:00:00 UTC
From: Brian Webb <102670.1206@CompuServe.COM>
Message-ID: <4nh056$p1b$1@mhafc.production.compuserve.com>
Source record: 200983
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Im looking for accurate information on how to optimize
VHF/UHF quad antennas (element lengths, tapering, spacing, etc).

I already know how to build quads.....now I want to build the
best possible quads.

Regards,

Brian Webb, KD6NRP

I quite agree adjusted properly the HTX-202 has some of the nicest audio available. It is also an excelent packet radio. But I have personally helped over two dozen people get them going on packet because of the non-standard keying circuit. This is one of the design problems I refer to.

>
>I don't think the rigs are perfect, but the intermod rejection of the
>202 is so far superior to anything else in the 2m handheld catagory I

>why anyone in a large city would by anything but the RS HTX-202.

Agreed the intermod rejection is among the best primarily because it will not go out of band and thus the filtering can be tighter. I stand by the poor quality control comments. All you have to do is pay attention to the questions about "err 2" to understand there is a design flaw. I guess I never will understand why people are so defensive about the R/S gear it no so bad but certainly not deserving of the reverence it deserves.

2503. For Sale Kenwood TS-940s/AT, SP-940, SM-220

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-17 00:00:00 UTC
From: spinsfcl@concentric.net
Message-ID: <319cb68f.5333012@news.concentric.net>
Source record: 200990

I will take the best offer for the entire system. There is a very minor problem in the TS940, for some reason it needs a two to three minute warm up period. Also, the TS940 has been modified for out of band transmission for MARS.

I am no longer active in MARS and would consider trading down to smaller HF rig.

Source record: 200996
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Would whoever it is that's anonymously sending the Guide to the Personal
Radio Newsgroups to folks who post forsale messages to the wrong group please
CUT IT THE HELL OUT?
I'm tired of getting complaints in my mailbox from folks who have been sent
3 copies of the same message from someone who is too damned cowardly to
attach their own name as the sender when passing it along.

While I'm somewhere near the subject, let me once again point out that
sending forsale postings to inappropriate groups is a Bad Idea. Forsale
postings should go to rec.radio.swap, the group chartered for that purpose,
ONLY. The profusion of forsale postings in rec.radio.amateur.equipment has
already caused that group to be dropped from some servers that, as a matter
of either law or policy, cannot carry traffic that benefits a particular
individual. (The examples I'm aware of are within the US Department of
Defense.) The same can happen with the other ham radio groups.

My objection is to the anonymous complaints only. I'm not sending them, I
have nothing to do with them, and I wish they'd stop.

2515. Icom Z1A 800 MHz mod kills 440

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-17 00:00:00 UTC
From: jimf@zoinks.corp.sgi.com
Message-ID: <4nio8q$j73@murrow.corp.sgi.com>
Source record: 201002

Hello all,

Ok after finally getting the two tiny surface mount transistors soldered into their spots I can receive 800 through ~1000 MHz just dandy.

But... I can no longer receive ANYTHING in the 70 cm band or for the local PD stuff at 482 - 488 MHz. I do receive stuff (maybe images) all along in 300 - 415 MHz range. Additionally, from about 420 to 445 the "S" meter shows full scale on nothing but white noise. Out side this range white noise is a minimal S 0.5 - 1.

Soldering was done by a professional MIL certified tech and the joints were inspected under microscope as well as continuity checks to the other ends of the traces. All looks/tests OK.

So... Did I screw something up? Or is this the way the mod is intended to work? BTW, the HT will TRANSMIT just fine at the intended offset from displayed freq along with tone etc.

Any ideas anyone that has done this?

Jim

I believe I always used an external receiver to do the null
and it worked just fine.

You can also use the try and try method of twisting the cap
until the "dip" in the plate current corresponds with maximum
RF output.

I recently built one and am quite satisfied with it. My power meter indicates
12W into dummy load on FM. Phone help is good, I stupidly installed GASFET
upside down, Tenn TEC sent new one free of charge. Did take me quite a bit
more time to assemble than I expected. If you're short on time the assembled
price represents good value.

>Transmitters ?

Hi Joe,

According to Chuck Penson's book, there is no matching receiver for the
DX-100, which was Heath's second entry into the ham radio market.

The matching receiver for the Marauder is the RX-1, "Mohawk", Heath's first
ham band only receiver.

The spreading codes that are used by ALL of the Part 15 devices are not legal under current Part 97 rules.... this, however is being changed, but it's unlikely even after the change you'll be able to use Part 15 devices undr Part 97 rules - the proposed Part 97 SS language requires a form (not specified) of automatic RF power reduction....

The Last 2 issues of CQ have had Articles on homebrewing QRP kits and even
homebrewed battery's using Hot sauce. There's also an Ad in the the same issues
for kit versions of these at $14.95 included all parts circuit board and Case
They are selling both Regular version and SMT version.
I think they have 10 meter,15 meter,20 meter,40 meter and 80 meter versions.

****NOTE****
The kits are Transmitters ONLY, you'll still need a Receiver.
Hope this helps ya'll

I'm currently considering to buy this rig but as I have, by now, not
seen any reports from the practical point of view, I'm holding back.

Is there anyone outthere who has gained some experience with the rig,
especially on CW as I intend to use it only for this mode.

How would you compare it to the nice IC-765 ? Is it worth the extra
money ?

73 de Tom.

I have an Azden PCS-7000H 2 meter mobile. One of the display lamps finally went out after over 2 years, so I decided to replace both before the other one went too...

The radio comes with a 2-year warranty, and I'm 6 months past that, so "fumble-fingers" got into the radio on his own. It turned out to be much trickier than I'd hoped and I had no luck getting the LCD to work right after reassembly.

I called their tech service and told them my woes and asked about replacement parts. The guy there (Lew, a ham) insisted I sent it back and that he'd fix it. Despite it being out of warranty, he fixed it right away, no charge. I sent it from MD Thurs at lunch and had it back the next Wed!

Azden gets high marks by me!

2531. ft50 and ic 7 (fwd)

Message-ID: <199605171619.MAA26336@serve.tech.mis.cfc.com>
Source record: 201068

I have recently returned to hamming after a long break, and am looking to
replace my Kenwood TH 41 with one of the new small dual banders.

I (think) have narrowed it down to the FT 50 or the Icom T 7.

Both offer extended frequency coverage that I want (I am also a pilot).

The Icom is a much simpler radio to operate, but does not have some of
the capabilities of the Yaesu.

The Icom comes standard with Pl decode and tone scan. A $50 dollar option on
the Yaesu.

The Yaesu comes with Digital Coded Squelch. Does anyone know what that is?
It is the first time I have heard of it..

The Yaesu also can have DTMF paging which is beginning to look better the
more I think about it.

The Yaesu is also direct FM which is supposed to give better Packet
performance.

The Yaesu almost seems to small, and fat, but I would probably adjust..

If their are any owners I would appreciate feedback. For instance on the
Yaesu,
can you store the freq, offset, pl tone,dcs code,and filter(am,fm,widefm)
in each memory spot..

In scanning could you scan the low air band and 2 meter at the same time and
would it know about the am section?

I have this lump in my wallet awaiting answers..

Thanks

Truth is...

The 'thru-the-glass' antenna(s) uses two plates as capacity-coupling
between the coax and antenna. It will never equal the efficiency of a
direct connection to the active element (period).

Here's the best way I know of!

Clark, WB6ADC has a MFJ-249 SWR Analyzer. The nice thing about this battery operated device is that it displays your antenna's specific resonant frequency direct on a 10 digit LCD display, from 1.9MHz~170MHz! No transmitting required.

We set my Quad up on a non-conductive mast and stood clear of any structures, wires and trees. In less than five minuets we had the Quad fully optimized for the input of our repeater! The Analyzer is very reasonably priced, every club should own one!

Jim -

PMFJI - I agree with Dick about the CAT Delux unit. Used it to
build code speed from zero to get me through the 20 wpm exam. I found
that the unit certainly has its flaws as pointed out in the QST
article. I also found that the LCD window was a significant advantage
and for me was worth the price of admission. Great item for practice
as I was driving and the earphone comes in handy when you want to
avoid disturbing others. The usual disclaimers apply, just a
satisfied customer.

I have done several installs on late model corvettes. And if
you can bring your self to drill a hole, check out the gas tank
cover you will find its metal. I have always used the Comet
B-20 dual band antenna and a Coment 3D4M assembly. And
have even installed the CX-801 tribancder on one of them.
You will find with the removal of a few screws you can route
the coax into the vehicle and concel it and the body of the
radio as well.
The next best thing is to use the Comet RS-520 mini mount
and the B-20. The mount should fit on the gas tank filler cover
without a problem and will allow you to rotate the antenna until
it is upright..

If you are worried about power, I suggest RG8/m (mini 8). The center conductor is 16 gauge (as opposed to 20 gauge for RG58 and 13 Gauge for RG8). These are Radio Shack's specs.

Hope this helps. 73 De KG0WX

<<

I hope this response is posted appropriately, AOL does not permit me to
control crossposts.

There is only the "duct tape" mod for the 202. It's extremely good
intermod rejection is due to the narrow band it is designed to recieve.
It is software controlled also, there are no mods.

Other radios can be modified because essentially the same radio is used in
other bands, and so by swapping a few components the company can use the
same design over a wide range. This has the consequence of making them
not very selective. THe 202 is designed for 144 to 148 only.

For the "duct tape" mod, you will need another radio, and some duct tape.
IT has the advantage of allowing recieve out to the 160 meter band, and up
tthrough the gigahertz, with proper radio choice. :)

I need the following for repeater equipment:

Cavities/Duplexer
Feed Line
Multi-Node Controller, VHF (perhaps with UHF links)
Antenna (onmidirectional)

Any ideas, please e-mail me. This repeater is for emergency use with the R=
ed Cross. =

Please help us help people.

Cheers!

something else you might consider: just because the needles say 1:1 and 100 watts doesn't mean that's what the antenna's putting out. If your little vertical isn't halfway resonant, you're tuning the feedline, not the stick.

Allan,
If the glass mount directions are followed to the letter you should not have any problems with them comming off. Most of the antenna manufacturers use a super-silicon glue. If you properly clean the glass before applying the glue it will really stick. I think this you best move for a fiberglass body car. There are some single band commercial antennas which do not require a ground plane but I don't remember seeing something which is a dual band which does not. Try looking for an Antenna Specialists catalog. Most two way radio shops have these. Look for the antennas which are used with Paramedic and ambulances. Most of those vehicals have a fiberglass top therefore they use special antennas which do not require a ground plane. One thing to note, the ground-plane-less antennas are usually very narrow band, not very good for the ham bands!.

I have the MFJ model. Very nice, but I agree with QST and others... you have to set it up every time you turn it on. Not difficult to do but a nuisance, also I found it rather hard on batteries, hardly used it and had to replace the battaries (??). Hope to increase my speed to Extra, not there yet but feel that the pocket trainers are far better than the tapes, and I can keep going up to 60 ! :-)

From: "B.C. 'Jay' Jackson, Jr." <jackson@mail.us.net>
Message-ID: <20823.jackson@mail.us.net>
Source record: 201108

Finally got around to completing mine last week. It works quite well, is very sensitive, and I get good signal reports from the local stations. One problem is that if I transmit a long winded exchange, the case gets rather warm, and worse, I have noted that the 94 MHz LO frequency drifts significantly with the temperature change.

For those still building or about to build, please note the following errors in the manual:

1. "wrong value". On assemby page 6, step 1-4. The manual says put in a 470 ohm resistor for R54. This is wrong. Instead, put in a 220 ohm resistor for R54. If you put in the 470 ohm like they say, the circuit will still work, but you won't discover the error until you get to assembly page 31, step 5-54b, where they will call for a 470 ohm resistor but you won't have any resistors left except for the 220 ohm that should have been put in back at the beginning. Then you'll have to carefully unsolder and pull it off the board, etc. At least that is what happened to me.

2. "duplicate installation". On assembly page 24, step 4-36. The manual says install L7, a 4.7 uH inductor. You will look all over the board for 15 minutes and never find a spot marked L7, (even though you will have an a 4.7 uH inductor left at that point). The reason is because you will already have installed L7 back on assembly page 8, step 1-51, and won't remebre doing it (at least I didn't). Likewise, assembly page 32, step 5-72 asks you to install the red LED wire that you've already installed earlier.

3. "corrections". TenTec sent me a letter with a 6.8k ohm resistor to be used at R15 (assembly page 8, step 2-20) in place of the 10k ohm that came with the kit. I went back and made the change, but it seemed to work OK with the 10k. In the letter they also clarified assembly page 24, instruction 4-33 as to the orientation of T3 - i.e. ignore the manual, install as on indicated on the board.

4. "tricky steps". The main problem I had building was the winding of RF transformers T4 and T5 (assembly page 29, steps 5-18 thru 5-24). DO NOT follow step 5-18 and cut the red teflon wire to 7.75 inches. If you do, it will be too short. Then you will have to call TenTec and ask for some more red teflon wire. They sent me about 3 feet of it (apparently thought I was gonna screw it up a few more times - HI) in the mail in a few days. Cut it to 8 inches, at least. What I did (the second time around) was prepare one end, solder at point A, then wind transformer, then, when you see about how long its gotta be to reach point B, then cut it! This worked and I had no further trouble with the transformers. However, I recommend that you

not install Q9 and T3 (at steps 4-32 and 4-33) until after you wind T4; because these will be in the way and may get bent.

I indulged my need to tinker and improve with one mod. I redrilled the LED hole in the case to 13/64" and installed a clear frosted bipolar LED on a little piece of PB board, together with two junk box NPN transistors and a few resistors. The LED gets 12 Volts off of the nearby on off switch, but I put a sense wire to the T test point (draws a few ma at most). That way, the LED glows green for power on in receive mode and red when in the transmit mode. Now I am thinking about a small RF relay and an additional connector on the back to bypass the transverter when it is turned off. I think that it is feasible despite what TenTec says.

The model 1209 is a really cool kit. You will enjoy building it (mostly) as it is challenging and works well when you get done. I am anxiously awaiting the Paragon kit (just kidding).

<<

Hi Chris-

I'd buy the 500 cycle filter as a second unit. But, it might be a waste of money to buy it since you already have one narrower. I have 1500, 500, and 250 cycle filters in my Drake R-4C receivers and I use the 250 cycle filter all the time, unless I am trying to copy a station that is drifting all over the place, really fast. If the station is drifting fairly slowly, I will still use the 250 and just follow `em. The narrow filter will spoil ya! <g>

It's great - buy one

"A shack in a box"

Audio is a bit iffy but its a savage 100w o/p on 6 and gives a good account with 10 on 2. I'm only VHF approved so haven't used the HF side in anger but its a damn good Rx apart from tinny audio but an extensipn speaker does help.

All i use is a 2/70 colinear, 6m vertical 1/4 wave and G5RV for HF Rx

Buy one!!

Very well, but this does not help much to optimize the antenna.
The primary concern in an optimization is to get a good radiation
pattern for the material you invest in the antenna. Of course
a good SWR is also needed, but there are many ways to get there.

>We set my Quad up on a non-conductive mast and stood clear of any

>
>I already know how to build quads.....now I want to build the
>best possible quads.

Hi Brian,

Since antenna software has widely become available, VHF and UHF
Yagis have been optimized considerably. Also the NEC-2 based codes
(e.g. EZNEC) allow to determine the radiation pattern of a VHF or UHF
antenna about as accurate as professional measurements.

This will also be the best way to optimize quads, I am sure someone
has done it.

PA>Does anyone know how I can "open" my TS-50S so it will transmit on any
PA>frequency (not just amateur bands)? Will this also still allow it to
PA>be used in connection with the AT-50 automatic antenna tuner?

TS-50
Expanded RF

1. Remove the bottom cover of the ts-50
2. Locate the PLL board-- it is the pc-board on top of the main board,
it has a shield on it's right side.
3. Locate the only non-surface mounted component on the PLL board look
near the rear left-hand side of the pll board (front of the radio
facing you) and remove the very obvious diode. You can't miss, there
is only one
4. Replace the cover.
5. Perform microprocessor reset as described in your manual.

2592. Low Power FM Broadcast

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-19 00:00:00 UTC
From: Bill_Combs@mgdmug.ORG
Message-ID: <199605191259.0129F64A@mgdmug.org>
Source record: 201029

I have a question that does not pertain to this list, but I have not been able to find any info anywhere so I thought I would see if anyone out there could help or direct me. I have called the FCC, but I can't seem to get past all the
bureaucrats in order to talk to someone who knows anything.

I am trying to find info on low power, noncommerical FM broadcast stations. The school where I work is interested in setting one up. Back in the 60s when I took my 2nd class radio telephone license, I remember questions about 10 watt FM
college stations that did not have to meet all the requirements of regular stations. Does anyone have any info on this. I am also interested in the requirements for noncommerical stations in general. I know they operate at the low end of
the FM band, around 88 to 89 mhz. I have gotten the impression from some of the things I have read (and it clearly may be a false impression) that people are operating 10 watt stations without a license. Is this now legal? I have looked at
the books which deal with the radio telephone commerical license, but again I find nothing about the noncommerical part of the band or about low power college stations in particular. I notice Ramsey Electronics is selling some 1 watt and
lower, stereo FM transmitters. They suggest, I believe, they are used by college stations.

Thanks,

Bill K4CPK

I bought a T22A in Febuary...I love it! The small size and light weight make it a joy to carry around. My only complaint is the lack of a backlit keypad...autopatch use is "interesting" at night. Take my advice - If you're in the market for a small, easy to use 2m HT, go with the T22A (the price is nice as well!) Be sure to get a better antenna for it, the stock rubber duck isn't very flexible or very good (I would suggest getting a Larsen Kulduckie...a million times better than the stock duck! If you need a stubby antenna, go with the Comet miracle baby...it really makes it handy!)

I hope this has helped.

Here is info about Fertik's in Philadelphia. It is from Leon Fertik's business card. Note, I suspect that the telephone number listed is his home number.

1(215)455-2121
5400 Ella Street
Phila, Pa 19120

Thur 7p-9p
Sat 9a - 3p

From Skuylkill Expressway, take US 1 North Bound. When the highway turns into a regular road, make a left turn at Rising Sun avenue. Take Rising Sun Avenue past the fire company and make an immediate left. This will get you onto Summerville. Go to the end of Sumerville. This is Ella St. You should see the warehouse a little on the right.

The directions are from the picture on the back of the business card.

My info is about 2 years old but I have confirmation that Mr. Fertik is still in business from another netter.

: >73, Dale WA2YPY

: I am not surprised to see this reply from Dale. AEA has always been HORIBLE
: when dealing with its customers! I sold ALL of my AEA equipment and now own
: Kantronics due to their lack of customer relations. Even if the AEA
: analizer was better, I would NOT buy it! Why should I, I would only get the
: "accuracy" of a $400.00 instrument. I can get that from an MFJ at HALF the
: price. AEA is a sad company...its really too bad.

: Dino Darling KC6RIX
: dinod@deltanet.com

I understand that Rod Proctor, the president of AEA was recently

replaced by Mike Lamb, the guy who started the company in the first

place. Since I heard from someone who knows that Proctor liked to

fire the competent people from the Mike Lamb days and replace them

with less experienced people, maybe Mike's return is a sign that the

above problems will go away. I sure hope so!

Check with International Radio in Florida. They are very experienced
with these radios. Do not even consider Tucker Electronics, since they
have no idea on what to do in the radio repair area.

Good Luck

Rebuilding the PSU is advisable. The last thing you want is the original design. Start again from the beginning. Also fit a decent blower and some safety features.

I bought 3 ht's before settling down with the w31a. I liked it so much I
bought a second one for my wife.

Dislikes:
If you want to use it as a scanner to scan within a frequency range, it is not
as user friendly as a good scanner. Other scanning functions work well.

Not sure on this one, but I don't think it does cross band repeat. The reason
I am not sure is that I have never been in a situation where a cross-band
repeating ht would be useful, so I've never tried it.

Likes:
True dual bander - you can receive on one band while transmitting on the
other. It also allows both halves of the radio to be used for the same band.
The radio can do VHF/UHF, VHF/VHF, UHF/UHF, and single band where you can
turn half of the radio off and just use it as a monobander. In mono-band
mode you can still switch back and forth between VHF and UHF.

Large display. Easy to read.

Excellent transmit audio and very good reveive audio.

Works 1200 packet with no problems.

Weather channels are built in and do not require any programming, nor do they
use up any memory slots.

Small and lite enough to be carried in a pocket.

Good battery performance.

When I checked mine it was doing about 7 watts when using the 12 v. adavpter

The backlit display is very nice.

Programming is very intuitive.

The knobs can be used for tuning or volume.

Mods available for rcv and transmit.

The antenna that comes with it works well.

Programmable ID, so if you have more than 1 you can tell which is which.

User settable memory labels.

There is more, but this is the top of the list.

: direct connection to the active element (period).

Oh, let me play Devil's Advocate here for a moment. Consider such a capacity coupling from a 50 ohm feedline to an antenna which has a feedpoint impedance of 40+j500 ohms, and the frequency and thru-glass coupling is such that the capacitance is 10-j500 ohms. Then the efficiency will be 80%, and we will have a perfect match to the feedline. Now consider directly coupling the same 50 ohm line directly to the same feedpoint impedance, so the SWR is, what, 10:1. Assume the line has a matched-line loss of 1dB. Then you must consider the additional loss on the line because of SWR, and any inefficiency in the matching network you will likely have to use at the other end of the line.

Of course, what I outlined is not a very practical example; it would be difficult to design a simple radiator with that high a ratio of inductive reactance to resistance, and further more, there would be no reason to not change the radiator somewhat to more closely match the line. But the point is that you should always consider the tradeoffs between actual complete systems, not just the loss in one element of the system.

I am in need of the programming board for the Motorola Micom-s HF-SSB radio.
This is the pc board that can be mounted inside the radio to program the channel information. Once the radio was programmed the board could be removed vrom the radio.
This radio was sold under the name Micom-s or Triton-s, bother were almost identical.
I might be interested in purchasing other parts for this series of radios, including the T-1959 automatic tuner.

snip... snip...

Agreed 100%... Even the best glass mt antenna has less gain than a mid to high end mag mt whip... The pattern is different, and there is more loss, I looked at the specs...

The big thing that has goone unnoticed is that glass mounts transmit better than they receive... This is especially true with a friend of mine who has the radio smack HTX-242 with the rad-smack dual band glass mount (which I personally think is a piece of crap). On a 5/8 wave antenna he picks up a repeater at "full scale", but on the glass mt the same repeater is S7 to S9... This particularly annoys me because we frequently talk simplex and I am often told to "turn up" my TX power (which never used to happen on his HTX-202-5/8 wave combo)..

I suppose that the 242 may not be as sensitive, and it may also have to do with the fact that he side-mounted the antenna, in other words didn't want to put it on the center of windshield or back window (due to defroster lines), so he put it on a side window on the back of his mini-van...

Anyhow we don't do much simplex now because of this, I'm trying to get him to at least get a 2M preamp or something to help... UHF just plain sucks, anywhere I can get with my duck I can get on this antenna...

Your comments please...

Thanks,
Steve W.

Mine hangs on really well. I knoked the little ball of of the top of it, after going through a low parkade too many times. Even after 2 years of that sort of abuse, I needed a heat gun, and a ton of elbow grease to remove it, to transfer it to my new vehicle.

A few years ago, I preformed this test:

I had three radios - Alinco DJ580, Yaesu FT470, and a Kenwood TH78.

I tested the radios, on 2m & 70cm, simplex, RX&TX. I tested all
combinations of the radios, mixing the antennas. The other station
a large all mode satelite station a good distance away. All the tests
were done three times in all modes. Man, did I kill some battery
packs.

Anyways, here were the results - #1 best, etc.

Alinco DJ580 antenna - #1 both bands
Kenwood TH78 antenna - #2 both bands, almost #1 on 440.
Yaesu FT470 antenna - #3 Both bands, almost #2 on 2 meters.

Hope this helps!

Hello all,

Some time ago I heard of a problem in Alinco DR-590 transceivers
involving a temperature sensitive squelch. Can anyone give me any
information about a fix to this problem.

Also, is it related to a downgrading in the receiver sensitivity?

Thanks,

Greg Towells

2643. Kenwood 732a seperation kit

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-20 00:00:00 UTC
From: amirault@laraby.tiac.net
Message-ID: <amirault.832551604@laraby.tiac.net>
Source record: 201045

I run a Kenwood 732a dual-band mobile.

I've just changed cars. The new car has much less space for radios.
The rig has the ability to seperate the faceplate from the body of the
radio, but (since this is no longer the current production model) I can
not find the seperation cable kit anywhere.

Anyone have one, or can point me in the right direction?

Time to retube the Galaxy GT-550. I'd rather give the money to another
ham than to a dealer, so here's the list of what the 550 uses. Looking
for NOS (unused) firebottles only:
6EJ7, 6EW6, 6GK6 (2), 6HG8, 6KE8, 6LB6 (2), 12AT7, 12BA6, 12BZ6, OB2, OC2.
Please let me know your prices.

73 from Hawaii,
Jeff KH2PZ

2646. 6 Meter, Yaesu FT625RD For Sale

2647. What's a Panasonic RF-4800 receiver worth?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-20 00:00:00 UTC
From: lsabo@ftn.net
Message-ID: <4nomol$d6i@master.ftn.net>
Source record: 201049

I just inherited this receiver; it's in like-new condition and works like a charm. I was wondering what it's worth?

I'm of two minds about selling it. I used to have my amateur radio operator's license about 35 years ago and thought perhaps I'd keep it and play with it for a while, or even get my license reinstated. The wife thinks otherwise. :-(

It covers 530 KHz - 31 MHz AM in 9 bands, and an 88-108 MHz FM band delivers very nice quality (mono) sound through a front pannel 4" speaker. It has a very nice 5-digit LED freq. readout for the SW bands, calibration trimmer, S meter, antenna tuning trimmer, RF gain adjustment, AM/CCW-SSB switch & BFO adjustment, switches for FM AFC, AM wide/narrow bandwidth, AM ANL, and a really smooth (but low mass) two-speed vernier tuning dial. It also has tone controls and jacks for headphones/external speakers, recorder and auxiliary (?). It runs off 110v 60 Hz, 8 enclosed "D" cells, or a 12 volt car battery.

Physically, it's about 7" high x 18" wide x 12" deep in a black metal cabinet with rack-mount-look handles.

Anyway, I would be greatful for any comments on the receiver, as well as fair market value estimates.

Larry

2648. Grid indicator of HF Liner Amplifier ????

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-20 00:00:00 UTC
From: "jaiyoung,yi" <comtech1@nextel.net>
Message-ID: <31A0CF76.2187@nextel.net>
Source record: 201050

I am using H.F amplifier. What I am worrying about is that I can't understand the indication of grid. When I am using amplifier on 20 meter band into one element quad antenna, the indication of grid is less than 25 amp with 600 watt -output in average. However, I am using it into three element quad antenna on 15 meter band, indication of grid shows me around 50 amp or more,but less than 70.(output is around 600 watt). What I wonder is that I am using same watt but different indication of grid. Is it good or not for me to have high indication of grid ?
Anyone who give information regarding this problem will highly be appreciated.

Okay, I have sinned. I posted a WTB ad for tubes on .equipment and rcvd
the following from Mr. Anonymous. I don't mind getting a scolding and
a copy of the charter, but why fear providing your real name and address?
Your message carries absolutely no weight without a name attached.
Which is a worse violation: My WTB or your anonymous note?

Jeff KH2PZ

Subject: Tubes Needed

The Rec.Radio.Amateur.* newsgroups are not the appropriate place
for posting Wanted or For Sale ads. The following guide to use of
the groups explains this. In the future, please use Rec.Radio.Swap
for this purpose.

The following is from the charter of the Rec.Radio groups:

"The swap group is rec.radio.swap. ... If you have radio
equipment, or test gear, or computer stuff that hams would be
interested in, here's the place. Equipment wanted postings belong
here too. Discussions about the equipment generally don't; ...

.. The .equipment group is not the place for buying or selling
equipment; that's what rec.radio.swap is for."

Following is the full charter:

Summary: This article provides an overview of the newsgroups
devoted to the personal radio services (amateur and CB), describes
each newsgroup and its charter, and gives a brief tutorial on
netiquette.

There's a trimmer in the hole on the TXCO, if you have that option, or
probably in the master oscillator circuit, if you don't. You can
zero-beat on WWV if you turn the IF shift all the way to the bassy
side with an SSB mode selected (use headphones to hear the zero beat
clearly). Make sure the set's fully warmed up before adjusting.

Tom
I tried the 775DSP for about 10 days last December and found it
very good indeed on cw.The RSGB code examiner who is an expert CW
operator has one and thinks it is gret. The Audio Pass Filter APF is
very good for CW.

I ended up buying he FT1000MP which is superb for my needs.

One word of caution....The early models of the 775 were troubled by
minor problems. Mainly connectors I believe, so you should check to
make sure that this has been sorted out.

Hope this is of some use....73

I have a TS-930 that exibits an intermitting receive problem. The receiver goes deaf to all but the strongest of signals but comes back to life (sometimes) when you change bands or turn the radio off and back on. Does anybody have any recomendations for a service shop that might be able to fix it?

Thanks, 73 de Ron / ki5oh

It is a expensive DUMMY LOAD for your HT. Its great to use if your want
to really cripple the TX of your HT. Do NOT waste your money.

I thought that you people bought the FT-50R for communications, not to
listen to stereo music. I bought mine for communications and it works
very well for that purpose, better than most. If I want to listen to
FM stereo, I have an AM/FM radio that I use for that. Returning the
unit because the "Wide band filter" is too narrow is NOT an acceptable
excuse for returning a superior unit to the dealer. I'm sorry, but
that's the way I feel. I use an FT-50R, FT10 and Icom IC-2350 for
A.R.E.S./R.A.C.E.S AND THEY WORK VERY, VERY WELL in this part of
Colorado as communications can be very poor in some areas. We don't
have repeaters on every hilltop or tall building in this area. I wish
that you would re-consider your decission about the FT-50R.

You don't have to listen to zero beat. It is easier and more accurate
to switch alternatively between USB and LSB and adjust the trimmer
until both sidebands exhibit the same tone.

I have no personal familiarity with the TS-820S, but this sounds like a classic case of an off-frequency carrier. It is very likely that realignment of the carrier oscillators (particularly any carrier that affects the positioning of the USB signal with respect to the filters) should correct the problem.

I *said* I would keep it. In a marketplace with several mostly
equal radios, it's extra features which make or break a sale for
me. I'm also an avid scanner listener, including Wide FM freqs.
To me, it's icing on the cake to be able to listen to TV and
FM audio radio than carry two, or three, radios with me.

BTW Yaesu certainly considered this reason "acceptable".

John,

If you would give me some more detailed information, I would be
happy to let you know exactly what you've got.

The Full Model #, the three letters in the serial number (tells when
born, what generation of board/firmware radio has "somewhat").

>>>>> or <<<<<

The numbers off of the top and bottom board, and the number off of
the ROM chip.

Examples are:

Controller Board: HLN5173B, HLN9313A, (have the ROM)
HLN9123A (this one does not have the ROM)

RF Board: HLF4095B or HLF9122A

P.A. Chassis: Look at the back for the presenceor absence of a

10-32 stud/nut in the heatsink area (the board
number is "buried").

>
>Thanks in advance . Steve WB5OMP shfoster@ix.netcom.com

Steve,

the SM100 supports ICOM, Yaesu and Kenwood HF rigs...the ICOM and Yaesu
must match whats in the book (did you get the manual?) to be compatible.

Almost ANY Kenwood HF rig will work that has computer control.....
The rigs must have a serial port for the SM100 to control them.

Yes, you can use a dual band radio and set the SM100 in FULL Duplex
operation....YET, legally, you must use a 220/440 dual band as the
downlink from SHackmaster HF to you is also Auxillary operation and
therefore must be above 222.15 Mhz to be legal....

A full duplex UHF rig is also workable or two UHF rigs on 5 Mhz offsets
with one hooked to Pri as RX only and the other hooked to Sec as TX only
and Shackmaster in full duplex mode.

Source record: 200821

To "HAM BURGER" (Sheesh...what a STUPID name):

Did you miss the apology I put out right after I noticed I had posted a FS: ad to the wrong group? I admit, I made a mistake, but I corrected it AND APOLOGIZED not 5 minutes after I made the post. I don't understand it; you afraid of me or something? Why don't you come out from behind that IDIOTIC alias of yours and try to show me what's up? The only people I thought used remailers are those sicko, perverted kiddie-porn guys you see on the news...you're probably a CB'er or something and don't want us to know you can't even get a callsign...just HOW is that 11M rig with the 1/4 wave whip doin' for ya' good buddy?

To everyone else: (Actually, "HAM BURGER", you'd better read this too.)

Excuse the temper there, but I just get a little upset when people have to try and be sneaky about things. Like I said, I made a mistake, and corrected it. In fact, I APOLOGIZE AGAIN for anyone that missed the first apology. I probably wouldn't have even gotten upset if whoever sent the charter to me (and everyone else) wouldn't try to hide behind some alias...besides, isn't that kind of warning best left to the moderator? If you have a problem, send HIM some email. I don't need somebody like "Ham Burger" ruining the notion that hams are some of the most helpful, nice people around, over something SO PETTY... rec.radio.amateur.equipment is one of the best resources we have. The only thing I can say for you, "Ham Burger", is that at least you were nice about it, even if you are a wimp...sorry to everyone that I had to waste bandwidth with this, but "Ham Burger" needed to have some things explained to him.

P.S. "STEVE PLAZER" (don't know if that's his real name or not) sent me a flame on this as well...well, the same goes for you, STEVE. Except you said a lot worse...why don't you come out from behind your remailer as well? By the way, the name isn't in the callsign directory, so I assume it's fake, or you're without license...in which case I respect you even less...

Source record: 200822

Is anyone aware of any other mods for the DJ-G5T besides the "cut the blue wire" for extended TX? I recently learned that the European version can be modified for 800 MHz RX but it supposedly has a different chip set in it. I've scrounged cyber-space without much luck.

Also, a friend of mine just bought a TM-742 at Dayton; he is trying to modify the 6m section for TX down to 45 MHz. He's been able to tune it down to 46, which is close, but not close enough... Has anyone succeeded with a similar mod?

Any info would be appreciated. Thanks much!

You seem to have a classic case of a bad changeover relay. This is really
not hard to repair as it is contained in the area just behind the coax
connector on the back panel of the TS 930. The relay is a small OMRON
unit easily avialable from Kenwood parts (order number is 1414-05).
Just remove the bottom cover and look before you go sending the unit
off. With a good antenna connected, simply tap the relay and if the
received signal comes back, you know that is the problem!

Let's congratulate the Hamvention organizers for moving the date to three weeks later! The weather was near perfect! Attendance seemed to be good, and there were DEALS TO BE HAD! I bought two 6146's for my SB-102 (first time I've replaced the tubes since I built the xcvr in 1969!) for $10.00 each and they work fine.

A new, higher output battery pack for my Kenwood TR-2500, and new Nicads for my Drake TR-22 rounded out my needed items.

Wanted goodies included a new SW rcvr for my ham-to-be son, and an HF vertical antenna and a length of RG59, then on to the computer stuff. 16 Meg 60ns w/parity for $169 was good, so I got two. That was all the money I had for the day, so I looked for microwave goodies. There were more microwave components at this show than at any other. Where else could you find Narda directional couplers for $25.00 (brand new condition, recent pulls from new equipment), or RLC SP6T switches for $75.00.

All in all, a very successful show, and the weather really helped.

See you all next year.

> that's the intuitive response looking at it.

I have one (somewhere, I lost it around the house someplace), but it all depends *what* you want to do with your antenna!

There is no ONE "best" antenna, because the "best" antenna is the antenna that does the job *you* need it to do better than any other antenna.

I can certainly imagine an instance where the Comet Miracle Baby would be the *best* antenna to use. Where you have a short range (or somewhat longer 'line-of-sight' range) and don't want the extended 'stick' of a rubber duckie getting caught on anything (ie. tower climing, hang-gliding to name 2 off hand)

And then, later on that same day another antenna (like the fine Diamond RH-77) could also be the "best" antenna for a different set of circumstances.

The antenna with the most gain does NOT automatically make it the "best" antenna, unless *thats* what you want from an antenna but remember if you get X dB gain from and antenna thats (say) 6" long, you might get 2xX dB gain from a 12" long antenna, and even more from a 24" antenna or a 48" antenna, and so on

Even the most die hard gain fan will draw the line somewhere. (hey, it's too long!)

Off my soap box now...73

Hello,

I ve a President LINCOLN (french name for HR2510) and i am very
interrested by
a chipswitch which is impossible to find in FRANCE.
Q :
What is a chipswith exactly ?
What are its possibilities(memories, shift tx/rx ...) ?
And about price and address to buy it ?

Many thank
73 & 51
Vincent

Hi,

I sold my Icom 27H 2 meter transceiver at Dayton. I forgot the owners
manual (bringing a manual for the TM-201B instead) and promised the buyer
that I'd send a manual once I found it.

I have searched and can not locate the 27H manual! I'd like to
send a manual to the buyer -- so does anyone have an extra manual or
copy thereof? I'll pay photo-copy costs and postage.

Thanks, Joe

2685. Problem with TS-520S

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-21 00:00:00 UTC
From: Joe Fitter BV/N0IAT <FITR%mimi@magic.itg.ti.com>
Message-ID: <31A260BD.16D7@magic.itg.ti.com>
Source record: 200837

I bought a TS-520S via the internet a few weeks ago. The
rig is in fair shape cosmetically (which the buyer pointed out)
but, the buyer did not warn me that the rig has a problem electrically.
Here's the problem:

In CW mode (and TUNE MODE) the CW crystal does not work. It seems
on CW the rig is entirely dead -- no RX audio, no TX, no sidetone.
There is no CW FILTER installed, and the brown jumper is wired
properly to the SSB jumper post near the SSB filter. Normally, one
would turn on the HV, mode setting to TUNE, meter to ALC and then
hunt for a meter peak while rotating the DRIVE control. I get zero
drive on the TUNE setting, same goes for the CW setting. Zip...no TX,
no RX.

On SSB (usb and lsb) the rig is fine. Using audio input, I can
tune the rig to the stated 100W pep output, getting proper drive, and
dipping the plate and peaking the grid via the load controls. It also
receives normally.

Problem: I only use CW! So, I have a worthless rig at this
point. I have little access to parts/tools, but some advice
on where to start would be helpful. I DO have a service
manual but it doesn to go into any depth on this. Can anyone
send me email and we can try to troubleshoot this together?

I have some ideas -- perhaps the 3.395 crystal is bad. I tried
tweaking the small cap near the 3.395 crystal, but no luck getting
things to work. Anyone experience this with a 520S before?

Thanks! Joe

Here is the extended TX mod that was on the internet. Please proceed at your own risk!!! This mod opens up TX in VHF 140-174 MHz and UHF 420-469 MHz

1. Take the battery off.
2. Peel the NiCd warning sticker off of the radio.
3. Remove the two screws that were under the sticker.
4. Gently pry off the keypad paying attention to the gasket.
5. You will be looking at 3 jumper pads.
6. The 1st pad on left above the number 1 will have a blob of solder on it.
7. Carefully remove the solder blob.
8. Reassemble the radio paying close attention to the gasket insertion.
9. Hit the reset keys as mentioned in the manual.
10. Extended TX mod is complete.

> Has anyone ever done any impartial performance comparisons on various
> rubber ducky antennas? Specifically for 2M and 70CM.

I did some pretty extensive comparisons of rubber duckies for both ham HTs and handheld scanners a number of years ago. I don't have the detailed findings with me, but I'll summarize from memory. I looked at monoband as well as dual band duckies for 2 meters and 440. I used the 2 meter rubber ducky my ICOM IC-2AT as a reference standard, since it was a basic, popular, garden variety ~6" helical antenna. On 440 MHz, I used the 6" ducky from my ICOM IC-4AT as a reference standard. This antenna is simply a non-helical, straight 1/4 wave whip.

Findings:

- The best rubber duckies were those elongated 15" - 18" models. The improvement was most apparent on 2 meters, where they performed about as well as a full 1/4 wave whip (which they virtually are). On 440, a standard 6" 1/4 wave seemed to work about as well in "real life" conditions where you're walking around holding the radio at various odd angles. The elongated antenna only seemed to improve things on 440 when the antenna was held vertical and kept free of obstructions. These antennas tend to be inconvenient. If you need maximum range on 2 meters, I'd rather go with a collapsible 1/2 wave whip which is easier to tuck away when not in use.

- The standard 6-7" 2-meter ducky seems to offer reasonable performance in a fairly convenient size. These were popular with older HTs, but the trend these days has been toward smaller antennas which generally do not perform as well. The size degradation was not noticed to any significant extent on 440, where the smaller ducks seemed to be on par with the the full 1/4 wave models. In fact, my Larsen 440 MHz 2" stubby duck seemed to edge out the 6" 1/4 wave in some tests by a db or so. Don't attempt this this trick on 2 meters though.

- Don't judge a duck solely on appearance, as there can be considerable performance differences between models of the same physical size (and in a couple of cases, between different samples of the same model). These differences are more apparent on 2 meters than on 440, and tend to be most pronounced among the shorter antennas. To get an idea of how well your duck is working, compare it with a 1/4 wave whip. I've found reception with a good standard size 2 meter duck to be within about 1 s-unit of a full 1/4 wave. With the worst ducks, signals that are virtually noise-free on the 1/4 wave completely disappear with the duck. (When making these comparisons, use several signal sources and be sure to move the radio around the room to compare aggregate

levels, rather than levels with the radio sitting in any one spot.)

- 2 meter ducks vary greatly in bandwidth; which is a significant consideration if you use the HT's extended receive capability. As a rule of thumb, longer ducks have better bandwidth. Standard size dual band ducks usually have much narrower VHF bandwidth than 2m monoband ducks, but there's also a lot of variation between dual band models. (Note that the in-band performance of dual band ducks generally seemed to match that of similar sized monoband ducks for their respective bands.)

To illustrate the bandwidth variation, I performed a receive test using the following antennas:

- 2 meter 1/4 wave whip
- ICOM IC-2AT 2 meter duck
- ICOM FA1443B dual band duck (7")
- Larsen 7" dual band duck
- Yaesu dual band duck from FT-470 (~7")

Within the 2 meter band, performance differences among the antennas were virtually nil (except for the 1/4 wave whip, which was a bit ahead of the pack). When the tests were repeated at 130 and 160 MHz, there were very striking differences between all of the antennas (except for a near tie between the Larsen and Yaesu). They are listed above in order of decreasing bandwidth. Note that the ICOM FA-1443B is a favorite of mine because its VHF bandwidth was notably greater than the other ~7" dual band antennas I tried. I use this antenna on my handheld scanner. (When ICOM introduced the IC-24AT, it supplied the HT with a shortened version of this antenna: the FA-1443BA. Everyone who bought a 24AT griped bout the poor performance of the ducky. Fortunately, ICOM has gone back to using the original FA-1443B in subsequent handhelds.)

The bottom line is that while there will always be performance compromises with small rubber ducky antennas, they do not have to be equivalent to a dummy load. If you have one that is, you can probably find something that works a lot better...especially if you don't mind adding an inch or two. If yours seems exceptionally bad, try swapping with someone who has the same radio to see if it might just be defective. (I once encountered a brand new 2AT whose stock antenna was a good 10-20 db worse than all other 2AT's, even though there seemed to be no physical defect. Icom sent him a free replacement. We later concluded that the rig was probably shipped with the wrong antenna.) Sometimes a little experimentation can go a long way.

73,
Greg Doerschler
N1DEM

p.s. I should mention that my experiments were done using only the relatively simple equipment which I had available at the time, and were

simply intended to satisfy my own curiousity. If you happen to be one of those who feel that no finding can possibly have any validity unless carried out in a controlled laboratory environment with multi-thousands of dollars worth of test equipment, kindly disregard everything I've said.

>
I really like the "hand tuned" antennas from Smiley Antenna Company,
which are sold by AES and other dealers. I have compared theirs to
the ones that come with various HTs (2m only) using my MFJ 249 SWR
analyzer. The difference was shocking, in every single case! The
Smiley antennas show minimum VSWR right where they belong, in the
2m band. In EVERY case, the antennas that came with the HT showed
minimum VSWR somewhere above 150 MHz, and in some cases showed a
reading of 5:1 in the 2m band! I've checked some Kenwood, Icom,
Yaesu, and Alinco duckies (but only one or two of each). This is
not a really "scientific" study, but it gets the point across. I
will continue to use the Smiley antennas. BTW, the ones I use are
a "shorty" and a "longie" (3" long, and about 9" long).

YMMV...

>73 Tom

Not sure what tube he is using but it must be a BIG SUCKA if it will
handle 25 - 50 AMPS of grid current!

Opinions expressed herein are my own and may not represent those of my employer.

2704. Standard 5718 experiences

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-22 00:00:00 UTC
From: pruth@alpha.cc.oberlin.edu
Message-ID: <4nv8se$dv4@news.cc.oberlin.edu>
Source record: 200712

I picked up a new Standard 5718 at the Hamvention and put it in
the car. A friend told me after the fact that I made a mistake,
that the control mike on this rig gets lots of problems down the
road, particularly with the buttons going bad. Is this true?
So far, the only problem I've encountered is ripping and peeling
of the thin rubber membrane covering the mike. I wonder if there's
an easy repair for that, too. I tried getting on to Standard's
homepage but it doesn't seem to work now. Any war stories and
advice will be greatly appreciated. 73 de Bill KB8USZ

Hello,
I am a member of a local EMERGENCY MANAGEMENT AGENCY and I just
picked up a Alinco DR-130T and want to know if anyone has any mods for
this
radio?? I would like to be able to transmit on it for my EMA group on
154.770

So, if anyone out there has any mods for this radio please let me
know...

Thanks all and hope to hear from you
soon

Is the capacitor actually defective? The Tune capacitor used to arc
occasionally in the amp that I own (before I fixed the problem),
but there was no permanent damage.

>What would make something like this arc over? I had no indication
>of trouble before the bzzzzzzt yesterday morning.

One of the things that can cause this is the T/R relay. If the
relay applies drive before it connects the load to the amplifier,
or if the contacts that connect the load are not in good condition,
the RF voltage at the input to the Pi-net can skyrocket. Depending
on the exact nature of the problem, this may occur only when the
amplifier is initially switched.

Another possibility is that the amplifier is oscillating, although
that seems unlikely if you haven't experienced problems until now.
This problem might also be caused by spurious signals in the output
of the driver.

Source record: 200715

I recently purchased a KLM 160-watt 2-meter amplifier, unfortunately I didn't get any paperwork with it. I need a copy of the schematic and tuning procedure if possible. Or, does anyone know how to tune one for maximum output that can tell me how here??? I could only see two pots that were adjustable. Would like to set it for the 146.52 direct section of the bank. Also noted a rear panel adjustment...What is that for???

The technical supplement finally came, and there's no evidence of a discrete
25 KHz or 75 KHz filter. I not so good with analog circuits, but it appears
that the Wide-FM switch single just switches in/out some RC components.
Seems like these would be easy to modify. I suppose I could scan the
schematic and post it if anyone's interested.

>In CW mode (and TUNE MODE) the CW crystal does not work. It seems
>on CW the rig is entirely dead -- no RX audio, no TX, no sidetone.

This doesn't sound like a problem in the carrier oscillator.
The Kenwood probably uses two different oscillators or oscillator
crystals on CW. Most rigs of that era used the USB crystal to
receive and the CW crystal to transmit. This is what provides
the frequency shift that allows you to hear the station you're
working. Without the shift, the received signal would be zero
beat (no audio). Also, the fact that there's no sidetone seems
to indicate that this may be a switching problem.

>Problem: I only use CW! So, I have a worthless rig at this
>point. I have little access to parts/tools, but some advice
>on where to start would be helpful. I DO have a service
>manual but it doesn to go into any depth on this. Can anyone
>send me email and we can try to troubleshoot this together?

To troubleshoot this yourself, you will need at least a schematic
and a voltmeter. If the problem turns out to be RF related
(rather than a switching problem), you will also need a high
impedance RF detector or oscilloscope.

>I have some ideas -- perhaps the 3.395 crystal is bad. I tried
>tweaking the small cap near the 3.395 crystal, but no luck getting
>things to work. Anyone experience this with a 520S before?

I haven't owned one of these, but it should be a straightforward
problem to troubleshoot. Unfortunately, you may also need a
frequency counter at this point, in order to realign the trimmer.
It would be a good idea not to adjust anything else until you
know for certain what has failed.

2712. GOES Timecode receiver TrueTime Model 468-DC

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-22 00:00:00 UTC
From: chrise@n0jcf.com
Message-ID: <4nvb2b$7at@n0jcf.com>
Source record: 200720
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

One of my Dayton souvenirs was a Kinemetrics True Time Division
Model 468-DC GOES satellite timecode receiver. I'm looking
for any information on this beast... particularly what sort
of antenna was connected to it. It appears that it might have
been some kind of active antenna that could have had an integral
downconverter.

GOES timecode is transmitted on either 468.8250 from GOES/West
or 468.8375 from GOES/East. The front panel of the receiver
has LEDs to indicate which satellite it is receiving.

The unit also has an RS232 serial port on the back which can
output the timecode to some connected serial device.

So, if anyone has any info-- schematics, user manual, command
set for the serial port, etc. I would be very interested in
hearing from you.

Thanks.

Hi to everybody

I have some questions on this tiny equipment
which in principle I found very nice. I have heard
that in the earlier versions it was not properly
adjusted and the reception was not very good on the higher
bands. I think this problem was already fixed by
ICOM itself, but can somebody tell me from which
serial number on this problem was fixed?
I would also know any psotive or negative feedback on it
and finally, what is the price of it in the USA?

Thanks to all for your help.

>business!!

I was the designer of that amp. Heath made the amps themselves, having
bought the kit design rights.

> Ameritron made this Amp for Heathkit but
>they only stock parts for their own products...at
>least this has been my experience.

No. Heath made the amp for Heath.

The transformer, bandswitch and other parts interchange. There are two
main problems with bandswitch life in the SB-1000.

First, the HV transformwer specs were changed. The unloaded voltage is
higher in the Heath, and that increases the tank voltages.

Second, the bandswitch had a anti-corona ring omitted, that lowered the
voltage of the bandswitch on the 160 meter wafer. That is the section that
has the highest voltage gradiant between the contacts, and the usual root
of the failure.

The wafers from the AL-80B will fit the mechanical supports and shaft of
the SB-1000, and IF you add the anti-corona ring the voltage breakdown
will be much higher.

To avoid arcing, ALWAYS load the amplifier very heavy (loading cap open).
Transformers for thee AL80A are no longer available, but they were much
better transformers and had reduced no load voltage. I am talking to Pete
Dahl about replacements now, so he may have some soon.

>HOW is that 11M rig with the 1/4 wave whip doin' for ya' good buddy?

Some people on here really are wound too tight. It's not that big of a
deal. FS announcements get posted to the .misc newsgroup all the time.

BTW, there is no "moderator" on this newsgroup, fortunately.

There was a big flap about this on .misc several months ago, and
accomplished the usual nothing. The FS posts continue to fly.

[snip]

>most helpful, nice people around, over something SO PETTY...

>nice about it, even if you are a wimp...sorry to everyone that I had
to
>waste bandwidth with this, but "Ham Burger" needed to have some things
>explained to him.

Again, a polite reminder is all that's necessary, but some people do
get overboard about it.

Thus far, I've seen only two rational arguments against FS postings in
other than rec.radio.swap [and the name here is the biggest part of the
problem]: that FS postings may cause the newsgroup to be dropped at
some sites [read: the employer's system] where commercial posts are not
allowed, and that some users have to pay for connect time or receiving
mail/news. The solution in both cases is to find a REAL provider, that
carries all 17,000+ of the newsgroups, for better or worse.

Sorry you had the bad experience here. At least you were man enough to
apologize for the mistake.

I keep hearing that some sites particularly military prohibit such postings but then see many "for sale" posts from .mil sites. This is a bit confusing. Perhaps at one time the rule were tighter or more stringently enforced but it seems that times have changed.

The second thought is perhaps you were a little hard on the guy Cecil, he had apologized said he wouldn't do it again. After all the OOTC doesn't extend to the net the local term is netcop. Spend a little time on 75 meter phone we could use a good OO there.

Source record: 200732

Two of my friends at Dayton purchased a Yaesu FT-50R dual band ht transcievers. They also bought the software programming package for it (version 1C).

During the download process, it stopped, and put the HT's in an European mode with 144-146MHz only, strange offsets. It now has some 220 capability, 440 capability, and now tunes the cell phone frequencies.

Not bad for a 2 meter-440 dual band... Well the radios are still stuck in this mode, and Yaesu is still puzzled. We now know that the radio has full coverage WELL beyond its claims. Now comes the part where we need to examine the download process to make these a tri band HT with scanner functions (including cell phone RX). These rigs will go up in price, if the tables/codes are understood.

I will keep you posted. Yaesu is in a panic. Don't use the 1C software programming software (for the FT-50R) on your PC until Yaesu has a fix.

>Another possibility is that the amplifier is oscillating, although
>that seems unlikely if you haven't experienced problems until now.
>This problem might also be caused by spurious signals in the output
>of the driver.

Actually the LK-500 used a capacitor that is only reliable to ~3000 volts
NO LOAD power supply voltage. It is the same cap used in the AL-80B and
other amps.

ANY mistuning or underloading of the amp will cause the cap to arc, and if
you replace the cap with a bigger one the arc will just move to another
under-rated component like the bandswitch.

The reason for this is whenever a class AB grounded grid PA is
underloaded, the tank voltage can soar. It can reach several times the dc
anode voltage under the right conditions.

Being driven on the wrong frequency by spurious emissions is virtually
impossible to be a problem. Self oscillation is also unlikely.

The overwhelming problem is, as Jack first indicated, much too "light"
loading allowing the tank voltage to soar. Some exciters also put out a
large peak when the envelope first rises. I've measured a Kenwood 950 at
240 watts peak when set to 100 watts out, and my ICOM 706 outputs 120
watts for an instant at key closure when set to 30 watts. The power
overshoot can trigger an arc also.

Hi,

I am looking for anything like bugs or good to know about
this Icoms dualband-multimode rig IC-820H. It is cheapest
of such rigs (containing 2m/70cm multimode) and is quide
new. For exp. Yeasu still sells it 736 which is quide old
and others like kenwoods 790 is not so simple to use..

I had heard roomers that 820 has lack of RF capabilities
on its receiver ?!

Well anyway if you might have some experience or have heard
about it let me know, that I won't trow my money to something
that doesnt work well..

I have Yaesu ft290r2 and I am quide satisfied to it but I would
like to have also multimode for 70cm (satellite working)
and f I buy single band rig it wuold cost me same or little more..
And with transvertes and so on it is allways hassle with cables..

That's interesting, my HTX-202 doesn't have any of the letter codes anywhere on
the machine itself so why do they list them in the manual? It seems like its
a simple adjustment using the Function+M-Set keys, find the RC and TC (receive
and transmit tones respectively) and turning the tuning knob to the correct
subaudible tone. What exactly do the letters do for the user?

I'd strongly suggest the BP-170 battery case, which holds 4 AA cells of your choice. You can "recharge" this case in about 30 seconds with a fresh set of AA cells. In emergency situations, the wall charger isn't going to work very well if AC power is out.

For long-term emergency use, a set of 4 AA lithium cells have a very long shelf life, and better performance in high current drain (hi power transmit) situations. You can also buy bulk packs of AA alkaline cells at most warehouse stores pretty cheap.

2750. Question: glass-mount glue?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-22 00:00:00 UTC
From: usdhicks@cc.memphis.edu
Message-ID: <1996May22.225248@msuvx1.memphis.edu>
Source record: 200758

Thanks for reading.

I am considering buying a glass-mount antenna for my scanner. I already have several mag-mounts on my roof, and I think the glass-mount is the best choice for my particulat application. But I have a question I'd like to ask before I go out and buy one:

What type of glue do you use to put it on with, and how well does it hold. If it holds too well, how do you get the antenna off? What if it doesn't hold too good? Does it fly off as you driving down the highway? And does it leave any markings on the glass after you remove it?

Any help or comments will be greatly appreciated. You can respond to me direct, or post it here so other's can read it.

Thanks & 73

2752. FT736R Mystery Choke

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-22 00:00:00 UTC
From: Guy Fletcher <guy@mpce.mq.edu.au>
Message-ID: <31A39897.5DDE@mpce.mq.edu.au>
Source record: 200842
Cross-posted to: rec.radio.amateur.equipment,aus.radio.amateur.misc

Under the top cover of the FT736R, in the back left-hand corner,
just to the right of and below a fuse board, is a brown toroidal
AF choke with one end wired to a stand-off tag. It is wired
directly in series with the main DC line to the 144MHz and 430MHz
PA Units, possibly also in series with the 2 optional PA units.
It is similar, possibly identical, to the choke L801 in the REG
Unit (see Connection Diagram, bottom left corner), but it is NOT
this choke.

The inclusion of an undecoupled AF choke in series with the main
power lead to a linear amplifier is a VERY STRANGE practice,
even unprecedented. Why is it there?

Naturally it has no effect in FM mode, but its effect is dramatic
on SSB. A voltmeter on the downstream side of this choke shows
little effect, but a CRO shows that the DC line varies by around
+/-4 volts with each audio cycle. This dramatically lowers the PA gain.

If you decouple the choke properly, the gain rises to such an
extent that the MIC gain must be turned right down, with the
further consequence that the speech processor becomes inoperative.

The mystery choke does NOT appear on the circuit diagram or parts
list. Did Yaesu fit it to mask some other instability problem?
It has all the appearance of a factory cludge, rather than
addressing the original problem it masks.

Any contributions from other owners (or Yaesu) would be fascinating.

I picked up a used Kenwood KSC-1 Rapid Charger. I can't find it in
any of the old AES catalogs. What battereis does it charge? Volts
etc.
It trickle charges ok, but I can't get it to rapaid charge on any
battery voltage. Maybe I need to hook up one of the sense contacts.
Anyone got a schematic? Ideas on how the 4 contacts hook up in the
battery?
Thanks, miker

2756. Needing Kenwood 7625 PA Module

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-22 00:00:00 UTC
From: mcduffie@hannibal.wncc.cc.ne.us
Message-ID: <31a2776d.13737786@164.119.101.2>
Source record: 200846

I am in need of a 7625 "brick". The one I have seems to have an internal intermittant. It is not reliable enough to put at an unmanned site, where I want it to run, but it will run all day at home (of course). Does anyone know where one might buy one? Or, do you happen to have a junker with a good PA you would sell at a reasonable price? Make an offer.

73 and thanks for your consideration,
Gary

Yes, this problem is not uncommon in the FT736R.
The rig takes off around 453MHz!
The problem lies in the VCO on the 430MHz RF Unit;
the input to this is inadequately decoupled.

I will email you details, and anyone else with the problem
may care to contact me by email.

Thanks to Gordon McDonald VK2ZAB, who tracked down this
problem on his own rig this morning. It hasn't yet surfaced
on my FT736R!

I agree with the folks who posted that advertised features should work as advertised, and the wide FM receive does not. I still like the radio but I'm wondering...

If it really is a matter of replacing a filter, wouldn't this be an opportunity for some hardware mod guy? I'd be more likely to pay for a mod like that than $100 to have a solder bridge opened for wide band receive or something. I have not found any compelling evidence that a 75 KHz filter is larger than a 25 KHz filter. In fact, I would think the opposite - a tighter filter may have more components. Just think, by this argument a VERY wideband filter would be exceedingly large - or maybe just a wire :-) . I'm not suggesting that a wire should be used to bypass the filter, but that a wider filter may be very possible. Of course, it's easier to talk about it than to do it. Any hardware mod folks want to take on this challenge?

Although the MFJ piece is a nice VSWR meter, aside from helping adjust for a 1:1 match, it does nothing for optimization. Field optimization is a long painstaking procedure requiring a proper range, test antenna, source and acurrate calibrated (in dB) receiver. In addition, unless the range is a slant range your efforts may be in vain.
Bob Haviland's (sp?) quad handbook is an excellent starting point. Beyond that Brian Beezley's Antenna Optimizer will allow you to "build 1000's of quads in minutes using gain, F/B and VSWR for optimization goals. Start w/ the book then enter the models into the program.

The Yaesu FT-5100:
I can't quite say enough about this fine machine. I've had one since last November. Truly provides 50w on 2m and 35w on 70cm. Operates nicely in crossband mode. Many fellow hams have commented on the nice audio. However, the #1 feature is the backlit dtmf microphone.

Now for the cons:
No extended rx coverage on 70cm band (there is a mod to remedy this, but I understand that it would significantly decrease intermod rejection)
No remote control for crossband repeater feature(of course, it's not meant to be used as a repeater)
It does not come standard with ctcss decoder ($50-$60 option-easy to install)

All in all, this radio is very easy to operate with your eyes closed, and I would anxiously purchase another one.

Thanks to all who answered here and by email. I am now a satisfied owner
of an MFJ-259. Seems pretty accurate and goes from Top Band to 2m in 1
unit. Jeff Welch on the MFJ booth at Dayton showed me the unit and then
pointed me to a nearby dealer's booth where it was being sold for $60 off
list. He also said he would help if I needed any help in alignment. Top
notch!

As an amateur operator you should already be aware that use of non-FCC Type accepted equipment is NOT permitted on commercial channels. Being found in violation of the rules could cost you your amateur license and your employer could lose his industrial radio license. This could mean that you'd also be looking for a new employer.

Every chip that is used in digital clocks has a 24 hr option. By properly accessing the chip, it is possible to get a 24 hr readout. What you need is a tech info sheet on the chip in your clock. You will see the correct pin identified and by grounding it or applying a voltage you will achieve the desired effect. By the way, digital clocks capable of displaying 24 hour format are cheap. (10.00 and up). You must have a really nice one that you want to convert. Have fun. If it is not too expensive, then you don't have much to lose. Anyway, as I said, it is just a pin that you have to identify on the chip. Ron KB6GK

2779. FCC Public Notice

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-23 00:00:00 UTC
From: "Gary P. Fiber" <gfiber@halcyon.com>
Message-ID: <01bb485f.39647b00$c4111dcc@gfiber.halcyon.com>
Source record: 200766

Well These types of notices usually mean some forth coming action from
the FCC, we'll see if they tell the manufacturers to stop making the HF
amateur radios capable of being opened up for all band TX.
This may be the start of new enforcement action to control illegal
operation of amateur equipment.

PUBLIC NOTICE
FEDERAL COMMUNICATIONS COMMISSION
1919 M STREET NW
WASHINGTON, D.C. 2055462882

News media information 202/418-0500.
Recorded listing of releases and texts 202/418-2222.

May 13, 1996

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the Commission's
Rules regarding equipment
that is intended to operate in various radio services in the high
frequency radio spectrum, including
"10-Meter" Amateur Radio Service (ARS) equipment.

The Commission has noted that a number of transceivers imported as
ARS equipment are
also capable of transmitting and are being operated in nearby frequency
bands allocated to other
radio services such as the Private Land Mobile Radio Services, Maritime
Services, Auxiliary
Broadcast Services, International Broadcasting Services, the Citizens Band
Radio Service, and the
U.S. Government. Operation of this equipment causes interference to the
authorized users of
these frequencies. Some of these transceivers are capable of using output
powers or emission
types which are not permitted for the radio services listed above and some
are capable of
transmitting in the radio astronomy band where no two-way
radiocommunication is permitted.
Some manufacturers are promoting the sale of conversion kits, or have
designed their transceivers
such that they can easily be modified by the users, to extend the
operating frequency range into
the frequency bands listed above. In addition, so called "export" radios
which are deliberately

designed to facilitate this capability are also being imported and marketed.

Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use. The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required, because of the simplicity of modifying them to extend their operating frequency range. Transmitters designed and intended for use only in the ARS must comply with the applicable technical standards contained in Part 97 of the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to: (1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio service(s) in which the transmitter is capable of operating; (2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued; or, (3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission-issued station license. Violation of the Commission's regulations will subject manufacturers, importers, vendors and users of this equipment to appropriate criminal penalties as provided for by federal law(s), including fines and/or imprisonment. In addition, the equipment described above can be seized by, and forfeited to, the government.

For further information concerning this Public Notice, contact Gary Hendrickson at the FCC Laboratory, 7435-A Oakland Mills Road, Columbia, Md. 21046, (301) 725-1585, Extension 223, or E-mail: ghendric@fcc.gov.

2780. Radio specs for Drake TR 33C

Hello and thanks for reading this post.

I just purchased a Icom P2AT handheld. Unfortunately, the seller could
not find the operating manual. I need to know the CPU reset sequence.

If you have this information, I would appreciate it very much.

Hey, anyone out here with a Standard 508a micro multi-band HT?

Just wondering how you liked it....I'm thinking of picking one up in addition to my Yaesu FT-51r dual bander HT....the 508a seems like a great little unit for my work with others using a Motorola commercial HT on the 154 MHz freqs...it's smaller than the Yeasu, and I like the idea of alkaline's....my Yeasu is getting pretty banged up from work...along with my amateur use.

If you know of a used Standard 508a for sale, I might be interested also!

Thanx,
Manny Tau WH6OQ

> My question is a little different-- I have the MFJ-208 for VHF and
> the MFJ-247 for HF. Would I be gaining anything (other than a
> single unit) by selling these two and buying the MFJ-259?

I don't see the 247 in the current catalogue so I can't comment on that,
but I note that the 208 shows VSWR but not an antenna's resistance at
resonance. If you fancy knowing this, and it may be useful when say
fiddling with gamma matches for instance, then the 259 will add that one
feature. Unless you can get most of your money back from selling the
older instruments or you do this for a living, it may not be worthwhile.
Of course, if you've not been naughty, you might try asking Santa :-)

>As an amateur operator you should already be aware that use of non-FCC
>Type accepted equipment is NOT permitted on commercial channels.

Just who is going to find this person in violation? Certainly the FCC isn't going to be around to do so. Maybe someone with a vested interest in radio users being forced to purchase over-priced type-accepted radios would report them?

>Being found in violation of the rules could cost you your amateur license
>and your employer could lose his industrial radio license. This could
>mean that you'd also be looking for a new employer.
>--
>Karl Beckman, P.E. < If our English language is so >

>** Opinions expressed here do NOT represent the views of Motorola Inc. **
>--
>Amateur radio WA8NVW NavyMARS NNN0VBH @ NOGBN.NOASI

And it could also mean that you folks at Motorola don't make *quite* as much money. Maybe if companies like yours didn't charge so much for your handhelds, or if you make them so they are easily programmed in the amateur bands (instead of having to buy a rib, software, and edit archive files, etc), more would consider the purchase of a type accepted radio for both commercial and amateur use. I use a Motorola handheld for both public safety and amateur, but I got a really good deal on it and already had the capabilty to program it. If that wasn't the case, the <$300 ham alternative would be the way to go.

Preach the rules all you want, but the rule everyone follows is the rule of economics. Figure out a better alternative and people will listen to you.

Turn off the radio
press and hold the moni and band buttons
turn on the radio and continue to hold the moni and band buttons for 5
seconds
release these buttons and make several presses of the band button to
see what the radio will now cover.

Have you see RT Systems windows bases software or ICOMs dos bases
software for the T7A yet ? Both look real nice.

If your are in the United States the FCC is watching

PUBLIC NOTICE
FEDERAL COMMUNICATIONS COMMISSION
1919 M STREET NW
WASHINGTON, D.C. 2055462882

News media information 202/418-0500.
Recorded listing of releases and texts 202/418-2222.

May 13, 1996

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the
Commission's Rules regarding equipment
that is intended to operate in various radio services in the high
frequency radio spectrum, including
"10-Meter" Amateur Radio Service (ARS) equipment.

The Commission has noted that a number of transceivers imported
as ARS equipment are
also capable of transmitting and are being operated in nearby
frequency bands allocated to other
radio services such as the Private Land Mobile Radio Services,
Maritime Services, Auxiliary
Broadcast Services, International Broadcasting Services, the Citizens
Band Radio Service, and the
U.S. Government. Operation of this equipment causes interference to
the authorized users of
these frequencies. Some of these transceivers are capable of using
output powers or emission
types which are not permitted for the radio services listed above and
some are capable of
transmitting in the radio astronomy band where no two-way
radiocommunication is permitted.
Some manufacturers are promoting the sale of conversion kits, or have

designed their transceivers
such that they can easily be modified by the users, to extend the
operating frequency range into
the frequency bands listed above. In addition, so called "export"
radios which are deliberately
designed to facilitate this capability are also being imported and
marketed.

Manufacturers, importers, vendors and users of these
transceivers are reminded that
transmitters intended for operation on frequencies allocated to any of
the FCC authorized radio
services listed above, except the ARS, must be type accepted by the
Commission for the particular
radio service(s) in which they are intended to operate prior to their
importation, marketing or use.
The Commission considers that the transceivers discussed above are
intended to be operated on
frequencies where the use of type accepted equipment is required,
because of the simplicity of
modifying them to extend their operating frequency range.
Transmitters designed and intended for
use only in the ARS must comply with the applicable technical
standards contained in Part 97 of
the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to: (1) import
or market a transmitter that is
designed or intended to operate on frequencies outside of the ARS
bands, if it has not been issued
a grant of equipment authorization for the radio service(s) in which
the transmitter is capable of
operating; (2) import, market or operate a transmitter that requires a
grant of equipment
authorization but for which no grant has been issued; or, (3) transmit
on a frequency allocated to a
licensed radio service without the appropriate Commission-issued
station license. Violation of the
Commission's regulations will subject manufacturers, importers,
vendors and users of this
equipment to appropriate criminal penalties as provided for by federal
law(s), including fines and/or
imprisonment. In addition, the equipment described above can be
seized by, and forfeited to, the
government.

For further information concerning this Public Notice, contact
Gary Hendrickson at the FCC
Laboratory, 7435-A Oakland Mills Road, Columbia, Md. 21046, (301)

Mark the date and time kids I am going to stick up for Jeff Herman.

Jeff I don't think you sinned. You were looking for older parts of
interest to a small subset of the hobby. If the holder of these parts
was not actively trying to sell it is unlikely he would be reading
rec.radio.swap by broadening the area of your request to equipment you
reach a larger number of folks who might have what you need. The
flamers seem to be some sort of control types who snipe from the
anonymous servers.

When seeking older parts it would seem that both .equipment and
homebrew would be places to make a connection. I am not advocating
turning either of these groups into swap nets but for the older and
more arcane stuff particularly parts and pieces it seems these are
logical meeting places. If it really offends to say the words "buy or
"sell" we could phrase it, "does anyone know where I can get ...".
Most of us are intelegent enough to figure out how to email to the
poster if we have such items we would part with.

I understand that Rod Proctor, the president of AEA was recently

replaced by Mike Lamb, the guy who started the company in the first

place. Since I heard from someone who knows that Proctor liked to

fire the competent people from the Mike Lamb days and replace them

with less experienced people, maybe Mike's return is a sign that the

above problems will go away. I sure hope so!

Thanks to all who answered here and by email. I am now a satisfied owner
of an MFJ-259. Seems pretty accurate and goes from Top Band to 2m in 1
unit. Jeff Welch on the MFJ booth at Dayton showed me the unit and then
pointed me to a nearby dealer's booth where it was being sold for $60 off
list. He also said he would help if I needed any help in alignment. Top
notch!

From: dddavis@atl.mindspring.com (Donald D. Davis, Jr.)
Subject: FT50-R Yaesu: NO FIX

I agree with the folks who posted that advertised features should work as advertised, and the wide FM receive does not. I still like the radio but I'm wondering...

If it really is a matter of replacing a filter, wouldn't this be an opportunity for some hardware mod guy? I'd be more likely to pay for a mod like that than $100 to have a solder bridge opened for wide band receive or something. I have not found any compelling evidence that a 75 KHz filter is larger than a 25 KHz filter. In fact, I would think the opposite - a tighter filter may have more components. Just think, by this argument a VERY wideband filter would be exceedingly large - or maybe just a wire :-) . I'm not suggesting that a wire should be used to bypass the filter, but that a wider filter may be very possible. Of course, it's easier to talk about it than to do it. Any hardware mod folks want to take on this challenge?

The technical supplement finally came, and there's no evidence of a discrete 25 KHz or 75 KHz filter. I not so good with analog circuits, but it appears that the Wide-FM switch single just switches in/out some RC components. Seems like these would be easy to modify. I suppose I could scan the schematic and post it if anyone's interested.

Is the capacitor actually defective? The Tune capacitor used to arc
occasionally in the amp that I own (before I fixed the problem),
but there was no permanent damage.

>What would make something like this arc over? I had no indication
>of trouble before the bzzzzzzt yesterday morning.

One of the things that can cause this is the T/R relay. If the
relay applies drive before it connects the load to the amplifier,
or if the contacts that connect the load are not in good condition,
the RF voltage at the input to the Pi-net can skyrocket. Depending
on the exact nature of the problem, this may occur only when the
amplifier is initially switched.

Another possibility is that the amplifier is oscillating, although
that seems unlikely if you haven't experienced problems until now.
This problem might also be caused by spurious signals in the output
of the driver.

From: Joe Fitter BV/N0IAT <FITR%mimi@magic.itg.ti.com>
Subject: Problem with TS-520S

I bought a TS-520S via the internet a few weeks ago. The
rig is in fair shape cosmetically (which the buyer pointed out)
but, the buyer did not warn me that the rig has a problem electrically.
Here's the problem:

In CW mode (and TUNE MODE) the CW crystal does not work. It seems
on CW the rig is entirely dead -- no RX audio, no TX, no sidetone.
There is no CW FILTER installed, and the brown jumper is wired
properly to the SSB jumper post near the SSB filter. Normally, one
would turn on the HV, mode setting to TUNE, meter to ALC and then
hunt for a meter peak while rotating the DRIVE control. I get zero
drive on the TUNE setting, same goes for the CW setting. Zip...no TX,
no RX.

On SSB (usb and lsb) the rig is fine. Using audio input, I can
tune the rig to the stated 100W pep output, getting proper drive, and
dipping the plate and peaking the grid via the load controls. It also
receives normally.

Problem: I only use CW! So, I have a worthless rig at this
point. I have little access to parts/tools, but some advice
on where to start would be helpful. I DO have a service
manual but it doesn to go into any depth on this. Can anyone
send me email and we can try to troubleshoot this together?

I have some ideas -- perhaps the 3.395 crystal is bad. I tried
tweaking the small cap near the 3.395 crystal, but no luck getting
things to work. Anyone experience this with a 520S before?

Thanks! Joe

> that's the intuitive response looking at it.

I have one (somewhere, I lost it around the house someplace), but it all
depends *what* you want to do with your antenna!

There is no ONE "best" antenna, because the "best" antenna is the antenna
that does the job *you* need it to do better than any other antenna.

I can certainly imagine an instance where the Comet Miracle Baby would be
the *best* antenna to use. Where you have a short range (or somewhat longer
'line-of-sight' range) and don't want the extended 'stick' of a rubber
duckie getting caught on anything (ie. tower climing, hang-gliding to

name 2 off hand)

And then, later on that same day another antenna (like the fine Diamond RH-77) could also be the "best" antenna for a different set of circumstances.

The antenna with the most gain does NOT automatically make it the "best" antenna, unless *thats* what you want from an antenna but remember if you get X dB gain from and antenna thats (say) 6" long, you might get 2xX dB gain from a 12" long antenna, and even more from a 24" antenna or a 48" antenna, and so on

Even the most die hard gain fan will draw the line somewhere. (hey, it's too long!)

Off my soap box now...73

Unfortunately, the "bricks" for the Kenwood TR-7600 and TR-7625
are no longer available, and there is no direct substitute for
either of them. (I own a TR-7600 and I've researched this)

I have the TR-7600 and TR-7626 service manuals, if you need to
borrow them to try to sub some other brick.

I'd check the carrier null on this one -- since it's idling that
high AND it's different between USB and LSB, it may not be just
DC bias that's off. See if there's a lot of RF with no audio.
You might also want to check to see that the frequency of the
carrier oscillator is set to fall on the slope of the crystal
filter correctly while you're at it.

Hot from ICOM this afternoon via FAX are the following mods for the
IC-2710H (I included any possible typos, you interpret it...):

==========

Expand frequency for USA version.

Notice: We can not guarantee specification when expand frequency.

How to expand frequency range.

Receive frequency only. (Three modification methods)
-USA version already expand VHF band.

-All frequency.
1) Cut the W18 jumper wire on MAIN unit.
-300 / 800 MHz band only.
1) Remove the D134 diode on MAIN unit.
(Do not cut W18 jumper wire)
-UHF band only.
1) Remove the D132 diode on MAIN unit.
(Do not cut W18 jumper wire)

-Receive freqency range.
118.000MHz - 135.995Mhz (AM / FM) Selectable mode.
138.000Mhz - 174.000MHz
320.000MHz - 399.995MHz (FM / AM) Selectable mode.
400.000MHz - 479.000MHz
849.000MHz - 869.000MHz / 894.000MHz - 850.000MHz
Note. Can not receive frequency between 869.000MHz to 894.000MHz.

-How to switch AM and FM receive mode.
1) Select AIR band or 320MHz band.
2) Push [MONI] key at more than 1 sec.
When select AM mode. Indicate '<' or '>' mark on display.

==========

Cross band repeater system.

How to set the cross band repeater system.

1) Cut the D139 diode on MAIN unit.
(Not necessary cut diode on USA version)
2) Set desire frequency on both band.
It is also selecable TONE frequency and frequency offset.
3) Push [VHF] and [UHF] main knob + [SET] key at same time.
When set the cross band repeater mode, Indicate 'L' display

at memory ch.

Note. It is selecable no hang up time repeate function.
Push [VHF] main dial knob + [UHF] main dial knob + [SET] key
+ [LOW] key at same time.

Caution: When you set para watech mode or cross set frequency.
Can not set cross band repeater mode.

How to release cross band repeater mode.

-Push [SET] key at more than 1 sec.

(following that was a circuit board layout showing the location of D139
as a leaded diode (non-surface mount) directly above the 'R' of the 'R440'
label and it is the left-most diode when you can read the 'R440' normal
side up.

==========

I have not yet tested these mods on my new radio. I will tonight... and
post any bad results here on rec.radio.amateur.equipment.

Hi Dave

Well Dayton yielded some interesting info, I was reminded that if I used an antenna that has a
limited 2M bandwidth this problem goes away. I bought a hamstick for two meters, it gives the performance over a simple 1/4 wave but the 6M power pickup was greatly reduce, well below a half watt. So I put back my 6M hamstick and used the newer 2 M hamstick. Unfortunately I get feedback on some freqs in the other 2M radio and the 11 M radio on certain
freqs but I can deal with that. Thanks for the info and 73's dave.

2821. Ten-Tec Corsair I vs. Corsair II question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-24 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <4o38q6$v90@pulp.ucs.ualberta.ca>
Source record: 200808

Hello,
I was flipping through some old QSTs today, and as usual I have come up with some questions. In the October 1983 edition, the original Corsair is advertised by Ten-Tec with a dynamic range in excess of 90db, and with a third order intercept of +5dbm with preamp, and +18dbm without. This measured at 20KHz spacing. This seems really impressive. I could not find an independent review of the rig, but compared these figures to the 1987 QST review of the Corsair II. It shows that the Corsair II exhibited a dynamic range of about 84db, and a third order intercept of -1 dbm at best. This was also measured at 20KHz spacing. Does this suggest that the Corsair II was a step backward as far as dynamic range characteristics are concerned, or are the original Ten-Tec specs exaggerated? Just curious about this discrepancy. Have the Corsair owners noticed any RX performance difference between these two rigs?
As always, thanks for your expertise.

2822. Programming Software for Ft-530 ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-24 00:00:00 UTC
From: cstimson@hookup.net
Message-ID: <4o3au7$fae@loki.tor.hookup.net>
Source record: 200809

I've been following the thread regarding ADMS software for the Yaesu FT-50 which has prompted me to ask the question about the FT-530. I understand there is presently nothing available but does anybody know if there may be anything in the works? I guess since the FT-530 is an old model now there may be no interest on the part of Yaesu however there still is a lot of dealers selling them an a lot of users who would be interested. It sure would come in handy to manage the memory locations.

Since the FT-530 does have some sort of digital (?) communication on the mic and/or speaker connections for the MH-29 & cloning capabilities it would seem possible.

Comments anyone??

2824. What tone is used to access 10m FM repeaters?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-24 00:00:00 UTC
From: mc@shore.net
Message-ID: <4o3jpl$cbp@northshore.shore.net>
Source record: 200811

I just returned from the Dayton Hamvention and an Icom IC-706 followed me home. I have not yet removed this technological marvel from its plastic protective bag and am trying to understand the manual. Boy - what a box!

It has been some time since I played around on 10M FM and cannot recall the tone frequency generally used to access 10M FM repeaters. Since the sunspot cycle will soon be increasing I am curious to know if this IC-706 will be able to work 10M FM repeaters. Can anyone confirm this tone frequency?

Tnx es 73,

The FT-530 does not contain the software routines in the radio itself to allow for cloning. The schematic does show a pin on the microprocessor label "clone" but Yaesu eliminated that feature but the first radio was sold.

What equipment do you have and what is your application? My analysers
have 50 ohm coax inputs rated to about 1 watt max and no probes are used.
Sometimes I plug in a short whip antenna to see what's around, just for
fun, but mostly I'm looking at stuff I'm generating locally such as my
transmission monitoring, checking out sig-gen's and oscillators, etc.

2828. Re: IC-706 Mods?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-24 00:00:00 UTC
From: mc@shore.net
Message-ID: <4o426j$ib4@northshore.shore.net>
Source record: 200865

From what I have read the "yellow wire" mod is to improve RECEPTION on the VHF portion of the IC-706's coverage, not add general coverage transmit capabilities. I have not performed either mod and do not plan to do them as I have no need for out-of-band transmit and an excellent scanner that covers VHF and UHF. These mods would most likely invalidate the warranty.

I bought the IC-706 for mobile HF - but boatanchors are my main interest!

2831. Re: need help with Realistic htx-202 dtmf(setting tones)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-24 00:00:00 UTC
From: afn35036@afn.org
Message-ID: <31a4f083.2201998@usenet.afn.org>
Source record: 200868

To set the CTCSS tone:

1. Press: VF (aka, D)
2. Press: M-SET (aka, F + 8)
3. Press: vSC or ^SC (aka, * or #, respectively) until "tc" setting appears.
4. Rotate TUNE knob to change transmit tone frequency.
5. If you also want to set the receive tone frequency, continue pressing the SC buttons until "rc" setting appears.
6. Rote TUNE knob to change receive tone frequency.

Summary: tc = transmit tone. rc = receive tone

2832. Need schematic for HP6220B power supply

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-24 00:00:00 UTC
From: chrise@n0jcf.com
Message-ID: <4o4hk4$ceo@n0jcf.com>
Source record: 200869
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,sci.electronics

Looking for the schematic (or even better the manual) for an HP6220B
DC power supply. It's a 0-50V, .5A / 0-25V, 1A bench top supply.
It was a "good deal" at Dayton... it makes output, which is adjustable,
however the metering circuit is bonkers. The meter swings wildly from
the negative peg to the positive peg in both voltage or current modes.

I'll reimburse for any duplicating/mailing costs.

Thanks.

>tone frequency?
(snip)

There is no "standard" tone... they're all different. The ARRL Repeater Directory will probably contain *some* of them, but not all. I'm really not sure how to determine what the tone is. If you hear a repeater, and can copy down its call sign (actually, the call sign of the trustee) you could contact that individual or club and ask them.

I have the same problem, but slightly different. There's a 10m machine one 29.56/.66 here in Dallas / Fort Worth, and they keep CHANGING the damned tone! I have no idea what it really is, but the tone listed in the Repeater Directory is not correct.

Geez... I miss the good ol' days in the early 1980s when propagation on 10m was incredible and the band was open day and night. I spent hours and hours working stations all over the place using converted CB radios and a few commercial rigs (Azden PCS-2800, Comtronix FM-80, etc). I'm looking forward to those days returning!

Good luck on 10m FM... Dean KC5NG

2835. Wanted: info on Graetz

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-24 00:00:00 UTC
From: calhoun@televar.com
Message-ID: <calhoun-2305962052330001@yakuser030.ncw.net>
Source record: 200872

I have inherited a tube radio and would like to find information about the company that produced it and where I will be able to find replacement parts for it. The company is called Graetz. The back of the radio is printed:
Graetz
Made In Germany
Fabricados en Elemania
Grazioso 4816E

I can identify 7 tubes. All tubes read:
TELE
FUN
KEN
Made In Germany

They have the indentification as follows:
EL84
ECH81
6AV6 U0309602
EF89 B1209503
???? B2109206
EM84 B8009600 acts as signal strength meter
1 tube wrapped in metal sheath

The radio can tune AM, FM SW1 (125-49 M), SW2 (41-13 M). The tuning ability of the SW is also rated in Mc.

On the front, the radio says it is stereo. It has plugs on the back for external antenas (multiple) and for external speakers.

The cabinet also contains a record player for 78's.

Any information about this radio or it's components would be appreciated.
Thanks,
dave calhoun

>
>73 Tom

IT would appear that the amplifier is not being loaded equally on the 2
bands you have described. That may be caused by a difference in matching
on the 2 bands, or less than ideal design of final tank circuits. Also,
it is not at all uncommon to experience lowered efficiency as frequency
increases, which requires higher levels of drive to obtain full output. A
final possibility is weakening final tubes. As Tom has stated,
informatin as to the actual amplifier in question would be helpful.

I have an HP 8565A analyzer, and need to look at signals using a 1
megohm+, as low capacitance as possible, high impedance probe. I can't
load the circuit much at all. An active probe would be fine, but I
would rather not reinvent the wheel, if such a probe design exists.

Thanks.
Kent

Maybe this will wake you up:

These notices usually precede some field action from the FCC. We'll see if they finally tell the manufacturers to stop making HF/VHF/UHF amateur radios capable of being opened up for all band TX or maybe even require design type approval of manufactured amateur equipment. This may finally be the start of some long overdue new enforcement action to control illegal operation of amateur equipment.

PUBLIC NOTICE
FEDERAL COMMUNICATIONS COMMISSION
1919 M STREET NW
WASHINGTON, D.C. 2055462882

News media information 202/418-0500.
Recorded listing of releases and texts 202/418-2222.

May 13, 1996

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the Commission's Rules regarding equipment that is intended to operate in various radio services in the high frequency radio spectrum, including "10-Meter" Amateur Radio Service (ARS) equipment.

The Commission has noted that a number of transceivers imported as ARS equipment are also capable of transmitting and are being operated in nearby frequency bands allocated to other radio services such as the Private Land Mobile Radio Services, Maritime Services, Auxiliary Broadcast Services, International Broadcasting Services, the Citizens Band Radio Service, and the U.S. Government. Operation of this equipment causes interference to the authorized users of these frequencies. Some of these transceivers are capable of using output powers or emission types which are not permitted for the radio services listed above and some are capable of transmitting in the radio astronomy band where no two-way radiocommunication is permitted. Some manufacturers are promoting the sale of conversion kits, or have designed their transceivers such that they can easily be modified by the users, to extend the operating frequency range into the frequency bands listed above. In addition, so called "export" radios which are deliberately designed to facilitate this capability are also being imported and marketed.

Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use. The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required, because of the simplicity of modifying them to extend their operating frequency range. Transmitters designed and intended for use only in the ARS must comply with the applicable technical standards contained in Part 97 of the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to:
(1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio service(s) in which the transmitter is capable of operating;
(2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued; or,
(3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission-issued station license.
Violation of the Commission's regulations will subject manufacturers, importers, vendors and users of this equipment to appropriate criminal penalties as provided for by federal law(s), including fines and/or imprisonment. In addition, the equipment described above can be seized by, and forfeited to, the government.

For further information concerning this Public Notice, contact Gary Hendrickson at the FCC Laboratory, 7435-A Oakland Mills Road, Columbia, Md. 21046, (301) 725-1585, Extension 223, or E-mail: ghendric@fcc.gov.

> anyone know how -- thanks for the help?? bob wb2flx

Well, it's really going to depend on the particular integrated circuit used
in a given clock...often it's as simple as changing the input state on one
pin of the clock IC, but you'd need some further info on the clock IC (or
perhaps a schematic of the clock) in order to figure out which pin to
jumper. If you can, look at the clock IC and see if you can figure out the
manufacturer and part # & include the info in a followup post; someone
reading the newsgroup just might have the datasheet you need. Hopefully,
the IC hasn't been "house marked", i.e., marked w/ a customer peculiar P/N
which is meaningless to the rest of the world.

If the clock was built entirely out of standard TTL or CMOS ICs (which
would likely be a rather old clock), it could require a bit more rework to
convert to a 24 hour display, but shouldn't be impossible to do.

There is a chance that the particular clock you have uses a clock IC which
doesn't allow for switchover to 24 hour display, in which case you're outta
luck. I bring this up because I seem to recall some mid-70's vintage clock
ICs - perhaps some of MOSTEK's clock ICs - which were built strictly for 12
hour display only. There may be some more recent chips configured for 12
hour only display as well.

sorry I can't address the ic7 but let me put another glowing report in on
the FT50R. I bought the FT50-41R (5w) -- love it -- very impressive
features and performance. Two things to remember -- it has an SMA
connector - so you should order a SMA/BNC adapter to be able to use your
existing antennas ($8). I also -- immediately went back and ordered the
the FTT-12 keyboard option ($64) - Gives you voice recording/playback,
DTMF code squelch and CTCSS decode capabilities.

==========
A week or so ago I posted an article about the ft50r and the
icom ic 7. So far I have had glorious reports on the ft50,

Hi,
The Maxtracs are 800 MHZ Trunked units. Depending on Model they may support conventional 800
MHZ operation. There is no mod that I am aware of to put these on the 900 Mhz amateur freqs.

In the SF Bay Area, There is no trunked service available for these radios. The radios are programmable only with Motorola software.

> Any preference on the mic elements. I Dx and contest, but dislike harsh
> audio.

James, I recently bought the HC5 Headset (not DX mic) for use with
the FT1000MP. The phones are exceptionally good and the mic is a bit
light on bass. I am pleased that I did not get the HC 4 because ,like
you I dislike harsh audio.

In summary the HC 5 is a very good product which is suitable for all
operating... in the case of short range QSOs on 80 meters then maybe
I would prefer the additional roundness provided by my desk mic.

I hope this helps 73--

I can't believe I did this! I'm not sorry ... yet. I walked into my local Ham Radio store to buy a used 2m HT to hook up to my packet TNC, and somehow got talked into buying an ICOM IC-T7A dual band HT. I spent more than twice my budget. What can I do to avoid this in the future? I love gadgets! Help!

I've changed it and not detected any differences. The technical supplement offers
no help in the matter. My guess is it does *nothing*.

If you find out let me know as well. I though that programming
motoral radio was illegal? Only authorized ressellers can? That is
what my dealer told me when I asked. Then again they charge about $15
to program the radio.

The FT-530 CAN'T be programmed by a PC. It has been tried many times
without luck. So I will save you the time and trouble.

You have to get a newer model like the FT-51R or FT-50R....

2870. Schematics/Parts list for Ramsey 2 Meter Kit?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-25 00:00:00 UTC
From: Brian Oblivion <oblivion@l0pht.com>
Message-ID: <31A77FE8.3505@l0pht.com>
Source record: 200678
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.swap

Greetings,

Has anyone built the Ramsey 2 Meter Kit and still have the Schematics/
Parts List still around? I just picked one up at a Hamfest for dirt
cheap so it's worth it for me to try and repair it. One component is
fried beyond recognition, hence my need for the schematic/list.

I'd really like to fix this rig. The exact part number of this rig is
either RK-FX146 or RK-FX220. I'm sure the cicuitry is close enough
for either part number.

Thanks.

Brian

Thanks for the reply, but that doesn't seem to work for me. I activate Tone
Squelch, then try F-2 to set Tone Frequency, and hold the Up key. AAs long
as I hold the key the value changes, but when I let go it stops. Do I need
to test this against a live signal with tone?

Thanks.

does anyone know if this amp can be setup to do several different
bands.. I was wishing to modify it back to amateur use from cb...
I got it for a great price <125 bucks> and have no intentions for using
it on 11 meter <honest>
I was however wanting to use it in line with a low power 6 meter radio
or <if possible> 2 meter..I know that 10 is possible cause that is what
it was before it was for cb...

can this be done, and if so is it possible to do both???

Hi Barry

>> Turn the radio with the FAST and the LOCK key pressed at the same time.

should be

Turn ON the radio with fast and lock keys depressed

this should enable the further menu items, note it is fast and lock

use fast and enter after this to enable normal menu mode

You should see further menu items 9-1 to 9-9 now

It works here

Dave

What's the frequency range needed for the antenna? If the frequency range is 25 MHz to 200 MHz, and you have access to some historical library/database of military standards, look up MIL-STD-461A (but _not_ MIL-STD-461, MIL-STD-461B, MIL-STD-461C, or MIL-STD-461D). Within MIL-STD-461A there exists some figures (Figures 2B through 2C-6, to be specific) which show how to modify a dipole antenna originally built for the venerable Singer NF-105 field intensity meter into a biconical antenna, with sufficient info to construct the detail parts needed. If you can't get your hands on MIL-STD-461A, e-mail me your postal address & I'll be glad to forward copies of the figures.

The tough part may be in finding the correct dipole antenna (the DM-105-T1, or the alternate antennas identified in MIL-STD-461A Fig. 2B); if you strike out on finding one, you'll have to do some R&D to come up w/ your own balun and matching network.

Hope this helps, & good luck -

TGB

Follow the manual like you are setting the tone frequency. Once in the frequency selection mode press and hold the UP or DOWN arrows keys until the tone frequencies start to change. Your radio must be set on the frequency you want to receive and have Tone Squelch turned on.

Swithing between sidebands usb and lsb is not the proper way to set the
master oscillator. You are probally thinking of the way to set the
carrier points without test equipment. If you want to be accurate and
apparently the original post is if they are concerned about 50 cycles.
Forget WWV and set the freq. with an accurate frequency counter.

Can't help you with the rest of the tubes, but the radio itself
seems familiar. I had a similar one without record player and used
it as an amplifier for several years. I suggest you check a tube
reference manual for information about replacement tubes.

Hope that helps,
Jens, DB9LL

Source record: 200902

One of the guys on CompuServe HamNet got ahold of an early version of the software interface that was just released and it is a little buggy - Seems that the code for the European version is in there and his FT-50R now has restored CELLULAR coverage! This is not a joke; I'm waiting to hear back from him to see if there's some obvious way to tell if you are buying the early version or not. (He now has the new code available to him, too.) I'm also waiting to see if we lose anything.

2890. Heil Pro headsets?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-25 00:00:00 UTC
From: FSWF37A@prodigy.com
Message-ID: <4o6u8p$1af0@usenetz1.news.prodigy.com>

Ham Burger is probably the same guy you see on that Gold Mastercard commercial who tries to forge his signature on the card, but can't.

I e-mailed him personally after my faux pas of putting a FS in the wrong newsgroup. I asked if he had slapped the wrists of the dozen or so others who committed the same sin--then told him to get some balls and come forth with HIS real name.

Ham, buddy--it's people like you who give this hobby a real bad name. Knock it off.

I have been using one for about 6 months. Can't remember the mic element's number but it's the one recommended for contesting, not casual rag chewing. I have gotten good audio reports.

If you are going to buy a Heil I strongly recommend you borrow one from a friend and wear use it for several hours at a time, as you would in a contest situation. I tried mine on in the store and it felt great. But after wearing for several hours I found it very uncomfortable. My ear's don't stick out very far from my head (at least I don't think they do!!!) but I wish there was more space between the outside of the earcushion and the flat plastic plate that holds the speaker. Or maybe thicker foam on the plastic plate. I hope to experiment with this in the near future, to see if thicker foam or a denser foam makes a difference.

Other than the comfort issue, I like mine just fine. Previously used a hand mic (when operating SSB) and an old pair or Rat Schack hi fi stereo headphones however, so I don't have much to compare to.

Message-ID: <4o7apslba1@mhafn.production.compuserve.com>
Source record: 200909

You might use HP85024A which is a 300 kHz - 3 GHz high impedance
probe (1 MOhm // 0.7 pF).
Also HP41800A with 5 Hz - 500 MHz bandwidth , 0.5 MOhm // 3 pF
Both with 50 Ohms, N connector output.

I'm not sure they are rated less than $2,500 but you may found
second hand one.
Good luck.

PS: I do not work for HP :-)

I just got an FT-50r and am confused about one of the funtions.
The knob function is SFT 24, which the manual does not talk
about. In the back, it says that it sets the CPU shift, so don't change
it. If it is so important, why make it a knob function that someone could
accidentally chage. Anyone know what this actually does?

From: John Kirby <jkirby@mcs.net>
Message-ID: <4o8hk5$clk@Nntp1.mcs.net>
Source record: 200688

I know of two mfg's of dual band amps (2m and 440), Mirage and R F Concepts, the Mirage has a max +/- 40 amp out with HT input of 1+, the R F Concepts output is only about 25 out at HT inputs, however RF has a unit with a pre amp.
Do you think the pre amp is worth sacrificing power for? I don't live in a fring area and the RF unit with the pre amp is also several $ higher in price.
The only time I think the pre amp would come in handy is when I am in the fring and this is what I would need the amp for anyway. I have been running my HT as a mobile using a Larsen dual band roof mount which has been working pretty good so far, but alittle more juice would come in handy at times, Any advice and/or experience appeciated. 73's KB9NLY.

Its not that reprogramming the radio itself is illegal. Its the fact
that you are doing it with unlicensed soffware. Motorola sofware can
only be purchased direct from apd, it cannot be resold once purcahsed
either. Give them a call, they will happily sell it to you, but they
make it $350 so that one one, other than a service shop, will buy it.

Hello,
I need some plans to build a cross band repeater interface for a 10M
FM Mobile and a 2M FM Mob. Any info would be helpful.

Please email

dwhowell@iamerica.net

2921. Kenwood

http://oak.oakland.edu:8080/pub/hamradio/mods/
is a good place to look for mods, here is what you want.
The C528 can be modded completely by button presses, I got
130-180 tx/rx 400-472 tx/rx
300-400rx 800-900rx
From: Young-Hoon Yoon <yoony@rpi.edu>

The Standard C520 or the C528 has tons of features.

TX/RX mod. Depending on the model(U.S. Japan, Europe) some of the
following
steps may be omitted.

First you must open up the RX. To do this

1. press VHF(144) button once to put the rig in the VHF side.
Then press Func-set then Func-ENT This will open up the rig for
extended
receive.
2. press UHF(450) button once to put the rig in the UHF side.
While keeping the function button pressed press the following
sequence
of buttons LAMP, SET, B, LAMP, 3. Once this is done 900 Mhz band
should
be open. To change bands press Func-Set, Func-3.
3. Once that's done now to open the TX part. Put your rig on VHF.
Change
your step size to 12.5, press CL(A) Press Func-8, Func-8, Func-7,
Func-7
Func-MS.M Now you should have the + sign with out the T and the
small
inverted triangle on the display. Set your frequency to 145.00 Mhz
Rotate the rotary knob and change the frequency to 144.9875. Press
Func-SET, Func-ENT then CL. Now your rig should be able to transmit
out of band. About 130Mhz to 176Mhz.

This mod will disappear once the rig is reset. If the rig's ever reset
you must do the mod sequence again.

==========

From: <U27387@uicvm.uic.edu>

This simple key-in sequence will enable the Standard 528 twin band HT
to receive out of band signals up 999MHz.
1) enter UHF side (UHF is main)
2) enter VFO mode
3) push F + L (function key + light key)
4) then F + 0 (function key + zero key)
5) next F + code (funtion key + code key)
6) then F + L (function key + light key (again))
7) next F + 3 (function key + three key)
8) then PTT (push to talk button)

Now your in! To change bands you have to press F + 0 followed by F + 3,
this is the toggle function. Each time you enter the F + 0 and F + 3
the receiver will jump bands. To get back to 440 (where you started
from)
keep using the toggle sequence.
If you did something wrong and the HT losses its mind DON'T PANIC! Just
push the microproc. reset button. I have done this keyboard entery mod
to
my HT and it works. The sensitivity isn't great, but you can pick up
any-
thing that has a strong signal.
This information was obtained from the local Standard representitive in
Chicago.

==========

From: Lawrie.Brown@adfa.oz.au
I too have a Standard C528 (as do quite a few of the other local
amateurs
here), and I'm very happy with it. In addition to the sequence you gave,
there is also a (longer) sequence which enables wide-band transmit (how
wide I don't know as I've no need to use it). There are also quite a few
additional functions available off the keyboard from those documented.
Appended below this is a table (which I keep as an Excel spreadsheet),
listing the various functions in rather abbreviated form - I'd be very
interested in learning about any others.

Note the extra memory channels - there are actually 20 on each band, the
upper 10 are accessed as shown below (accesed with a F+A prefix key,
and displayed with a bar over the number). You can't use them in band
scanning, but apart from that they function as normal memories.

Standard C528 Keystroke Cheat-sheet
Key\Seq key F+key Set,key Set,F+key

40 CHANNALS MEMORY

There are 2 memory channels per memory number on VHF and UHF. They can be
used in 2 ways.
(A)To provide programble RX TX frequencies
(B)To double the simplex channels available
(A)
1 SELECT RX FREQ (VFO MODE)
2 F + D
3 PRESS MEMORY NO TO BE PROGRAMMED
4 D
5 SELECT TX FREQUENCY
6 F + D
7 F + THE MEMORY NO TO BE PROGRAMMED
+ - will appear indicates that memory channel is in split frequency mode
Once a memory is in split mode it cannot be changed back to a single
memory unless its programmed as a extra channel (see below) or reset

F + 9 WILL SWAP RX AND TX

(B) Extend to 40 memories
Program first 10 memories in each band to program additional 10 memories
1 SELECT FREQUENCY (VFO MODE)
2 F + D _
3 F + A AN M WILL APPEAR
4 PRESS MEMORY NO TO BE PROGRAMMED
To recall extra memories use rotary control in memory mode or enter memory
mode and press
F + A
THE M AND BAR APPEARS PRESSING
0 to 9 will recall ex channels the ex channels can have rep shift
and ctcss tones but value will be the same for both channels in one
memory

DTMF CLONE
COPYS YOUR SETTINGS TO ANOTHER 520/28

TUNE BOTH RADIOS TO SAME FREQUENCY
1 B P IS DISPLAYED
2 B C IS DISPLAYED
3 F + 0
4 F + PS
5 PTT ONLY ON THE RADIO THAT CONTAINS THE MEMORY DATA
A series of tones will be heard for approx 2 minutes the radio memorys
will now be identical

DTMF SINGLE TONE
1 F + 0
2 F + 7
TO CANCEL REPEAT ABOVE

MUTING THE AUDIO OUTPUT OF PAGER
1 F + 0
2 F + 5
TO CANCEL REPEAT ABOVE

TONE SQUELCH SCAN STOP
1 F + 0
2 F + 2
TO CANCEL REPEAT ABOVE

H.H.TRANSPONDER SUB BAND TO MAIN
1 F + 0
2 F + 8
A . APPEARS TOP RIGHT OF MEMORY NO
TO CANCEL SET SUB BAND ON CLEAR FREQUENCY BY ROTARY SELECTOR AND PRESS
UHF OR
VHF

TOGGELS BETWEEN 100KHz AND 1MHz STEPS
ON ROTARY SELECTOR WHEN FUNC IS PRESSED (FAST TUNING RATE)
1 F + 0
2 F + 6

SET FREQUENCY LIMIT ON EACH BAND
1 F + 0
2 F + 0

SET TX HANG DURING TRANAPONDER FUNC
1 F + 0
2 F + 1

Be very carfull with the h.h.transponder
and wide band tx func.

G7IED @ GB7FCI

==========

From: <U27387@uicvm.uic.edu>
Subject: Standard C528A receiver mods (999MHz)

To enable the Standard twin band HT to receive way out of band enter the
following key-board sequence.
First enter UHF side (UHF main)
then enter VFO mode, now follow these steps..
1) press F + L (function key + light key)
2) press F + 0 (function key + zero key)
2) press F + code (function key + code key)
3) press F + L (function key + light key (again))
4) press F + 3 (function key + three key)
5) " " PTT (push to talk button (will not xmit))

now press the F + 0 (function key + zero key) and the F + 3 (function
key
+ three key) to toggle bands. i.e. you are starting out at 440MHz,
push
the F + 0 and F + 3. Now you should be at 840MHz. If you want to get
back to 440MHz keep pushing the toggle sequence and your wish will come
true.

==========

Hi All,
another mode from Elio IK4NYY.
I would like to thank him for the mod plus a very big Thanks to Steve's
(G8SFR)
Xyl Alison for retypeing out the mod for me into English.
This has been sent mainly as a guide and that i can not be of any help
if you
run into trouble, but i bet there are more tec minded people that can
help
you.

De Steve G0OMM @ GB7OMM.#34.GBR.EU

With this simple mod, you can upgrade your Standard C520/528 using
rechargable batteries without having to spend a lot.
You will need to get 6 rechargeables of 600\700 mah, a resister of 33ohm
2 watt
and two diodes of 1 amp type 1N4004.
Start by taking off the outside cover. To open the transceiver, you
need to
remove the small metal plate where you will find the battery pack
held in
place by 4 little screws, the cross-headed screws mounted laterally
on the
back.
It's all you have to do, the transceiver will open.
Carefully open the two parts holding together from the flat cable
upon which

half you should find the finger control/keyboard and a long wire approx
7 cms.
You can't miss it, it's the only wire there is.
Now, from the point where this is soldered onto the lower, bottom part
of the
transceiver, solder a small piece of wire about 3 or 4cms.
The other end should be soldered to the PCB where there is a
large/fat/wide
soldered little square (PCB Track?) which also cannot be missed
tacking as
orientation the connector from the external power supply: The said
little
square stands on its own and with this the mod on the inside of the
apparatus
are complete and can now recharge them

Now let us look at the battery pack (Model CBT 151).
Open the two parts and take out only that one where you see the
sign +
(positive).
Note where the first battery is, its positive pole resting on the
little
metallic tab(tongue) having the shape and the characteristics of a
corner
angle slipped off from its housing towards the top.
Do not worry, it is only fixed in and divides with cutters in the middle
of the
corner/angle.
Be careful when separating with the cutters, The two parts may tend
to fall
apart, thus, if you are not careful you can lose a piece.
If this happens, do not worry , but be very careful that this does not
happen.
Take the smallest piece, namely that which is mounteed next to the +
symbol and
solder on top of the terminals the two diodes in series opposite in
between,
namely an anode and a cathode.
Mind that the pieces of the terminals are chromed metal, ie, on the
point when
you intend to solder the join, it is necessary you clean in a bit first
with a
thin sanding paper, solder it and try to slide it away; you can also
help by
using some soldering flux such as a deoxydising one.
Do this soldering, solder the diodes to the very edges of the resister
(divie
the leads furthest most extreme side k cathode diod-resistance).

Now remount the first piece on the capaciter moulded sockets of
resistor of 33

ohms and diodes so that they can be fixed in the restricted space at
the side
of the first battery.
Also replace the other piece of the metal tab onto place and solder it
on top
of the terminal along the resister (on to which is attached :- A anode
of the
diode.
That is basically it.
One last thing, make absolutely sure that there exists no kind of
electrical
contact from the two metal tabs from your solders.
Mount on the battery carriers the six rechargeable batteries, check
again the
whole thing and connect on the switch of the external feeder/power
supply a
voltage of 10 to 12 volts and let the batteries charge up.
The apparatus can then work on batteries and with the power
supply; When
working with the latter, The batteries will just charge up, In spite of
all the
modification...

==========

From: dplumb@cix.compulink.co.uk (Dave Plumb)

Standard C520/C528 Modifications
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
This file is a compendium from to others being bandied about the place.
It
is hoped this will be the better of them, being the easiest to follow!

o To open up the rx only up on the unit on VHF:
VHF F+0 F+D

o To add 320-400MHz, 400-480MHz, 820-900MHz, 900-980MHz:
UHF F+L F+0 F+B F+L F+3 A

o To Expand Tx/Rx coverage, do both the above in that order, then:
VHF F+6 change step to 12.5MHz A
F+8 F+8 F+C
Tune down to 144.9875
F+0 F+D PTT F+8 F+C

o To Store independent transmit/receive frequency in one channel:
Enter receive frequency into dial
F+D <mem number>
Enter transmit frequency into dial
F+D F+A F+<mem number> A

o To Clear the tx assignment offset:
F+D F+A <mem number>+A F+A A
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

o To Clone one set to another:
B B F+0 F+PS then key up on the set to clone from

Set mode key assignments:
The set mode allows a number of user parameters to be customised
according
to individual taste. Set mode is initiated by pressing F+0. The
following
are entered after going into set mode:

0 Turns off the beep tones on each keypress
F+0 Sets band edge limits, i.e. 0079=100-179, 400-479. 3060=130-160

1 Changes count of paging operations tone, one beep or 5
F+1 Set tx delay on carrier drop when using as cross-band repeater

2 Enables entry of the 1kHz figure on direct keypad entry
F+2 Stop scan on busy channel even if CTCSS doesn't match

3 Sets mod delay on paging Tx to either 450ms or 750ms
F+3 Switch UHF bands between 300/400/800/900

4 Mutes short noises during squelch operation
F+4 Keypad entry of 4 digit or 3 digit frequency

5 Turns on and off the auto power off function
F+5 Pager Audio Mute (effectively disables pager)

6 Enable/Disable the rotary channel knob when keypad locked
F+6 Fast tune (F+KNOB) gives either 1MHz steps, or 100kHz

7 Sets the CTCSS tone frequency
F+7 Either Dual Tone Multi Frequency, or Single Tone Frequency

8 Sets the offset repeater frequency
F+8 Cross Band Repeater Enable/Disable (Identified on display by a
".")

9 Changes the LAMP button into the REV button
F+9 Up and Down keys either act as the knob, or as 10MHz steps.

Quick Chart:

| Enter receive frequency into dial
|
| F+D <mem number>
|
| Enter transmit frequency into dial
|
| F+D F+A F+<mem number> A
|
|-------------------------------------------------------------------------|
| To remove independent transmit frequency from memory
|
|-------------------------------------------------------------------------|
| F+D F+A <mem number>+A F+A A
|
|-------------------------------------------------------------------------|
| To clone one set to another
|
|-------------------------------------------------------------------------|
| B B F+0 F+PS on both sets, and PTT on the one to clone from
|
\-------------------------------------------------------------------------/
```

==========

From: dplumb@cix.compulink.co.uk (Dave Plumb)

the mod for the C528
it's:

VHF F+0 F+D UHF F+L F+0 F+B F+L F+3 A

The "L" is the light, F+L means press function, and while pressing
function,
press the "Light" button. The above sequence opens up the set for rx
for all
limits.

2927. What kind of antenna is this?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-26 00:00:00 UTC
From: hturn@pelican.davlin.net
Message-ID: <31a81da3.23755608@news.davlin.net>
Source record: 200698

I have just aquired a military antenna and I was wondering what
exactly I have. It seems to be a very large mobile antenna.

It consists of the bottom (base) which is about 24 inches long and 3
inches in diameter painted green. N type connecter on the side about
9 inches from the bottom. Stamped on the base is the following:

ANTENNA AT-1062/G
ORDER NO. 40512-PM-60
MOTOROLA INC. SER.NO. 1

Yes ser.no. 1.

After the base is a very heavy steel spring. Then comes 24 inches of
half inch aluminum tube on the end of which is a compression nut where
a whip such as a 102 incher would fit.

Any ideas as to what I have aquired?

Does the N type connector indicate that this is a VHF or UHF antenna?

Let me know if you have any ideas I am tempted to disasemble the base
but don't dare to now.

Thanks Hank.

: Don AC6TG

I got one at the $39 price. So far I can't see any improvement over the
standard filters in my IC706, but for that price, I'm sure I can find a
use for it.

Does anyone know how to remove the restrictions on the radio so you can transmit on all the freq. you can recieve on ? It's really annoying to be able to recieve all those freq but to be able to transmit on only a select few. I know there is a reason for the restrictions, but I am not sure what it is :)
Thanks in advance

Hi! I have a fellow ham who's picked up an old Motorala Micor. He's looking for any kind of a manual with schematics . The only information he has is off the radio itself.

FCC Xmtr Data : CC 3161

Model T83RTA1404BA

S/N 203CDE4804

We have no idea what range the radio is designed to operate in. His plans are to modify it to operate in either the 2 meter range or 7 cm. range. I'm not sure but I think he wants to use it for a repeater.

He'd be grateful for any info.

You can email me at : johnestein@mcn.net as well.

Thanks!
John

That's also been my experience on the air. Listening to operators
in A-B tests, the Heil mics always sound less natural and more
strident than the typical desk mic. I wouldn't even consider one
of these except for contesting and dedicated DX'ing.

Source record: 200465
Cross-posted to: rec.radio.swap,rec.radio.amateur.misc,rec.radio.amateur.equipment

Hello,

Yesterday when I turned on my Alinco 1200, it seemed to be dead but on closer inspection the radio worked OK but all of the panel lights are out. Actually when I first turned it on, one of the lights seemed to be on, but very dim and later all were out.

I would be willing to buy a service manual if anyone has one. If anyone would be willing to share their knowledge/experience or look up what I need that would be good too. Is there a micro-fuse inline with the panel LED's? Are they connected in series so that if one is out, they all go out? Has this happened to anyone else? I took it apart but could not spot any problems. Everything else seems to work. Please Email rather than post responses. Thanks...

If I remember correctly, copy down all your memories as you will lose
them, then take the top off the radio, you will find a obvious wire loop
blue I believe, maybe red, going to the front panel cut that wire turn
on and reset the radio you are all set then, reprogram the radio.

2956. Ignition noise problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-27 00:00:00 UTC
From: msl@nauticom.net
Message-ID: <4o3ae3$gbs_001@net8.nauticom.net>
Source record: 200477

I have a 1988 Chrysler LeBaron which I can't seem to "quiet down".
The ignition noise is so bad that HF operation with the engine running
is impossible. It even is bad enough to knock out the AM broadcast
radio! So far, I've done the following:

--new resistor plugs, wiring, distributor cap
--ground straps between the antenna mount, engine block, hood, trunk,
doors, and exhaust system to the frame
--power leads run directly to battery with #10 wire
--bypass caps on the voltage regulator
--alternator noise filter installed

The rig is a Yaesu FT900. The noise blanker reduces the noise from S9
to S7 but no further. The antenna is a High Sierra "Screwdriver"
mounted on a trailer hitch (which also has been ground-strapped to the
frame).

Any ideas? This one is really beginning to bug me...have never had a
car give me as hard a time as this one is.

73, Mike KB3RG

This is not correct. The 6146W is a ruggedized version of the
6146A. Like the 6146A, it is rated at 25 watts plate dissipation.
The 6146B is rated at 35 watts.

Sounds like something is wrong; it should have worked just as described.
When you hold the Up key for a second it should start scanning the tone
frequencies. It scans quickly when no RF is being received, then slows
down when a signal is detected, then stops when the matching tone freq is
detected. Or at least, mine does. Do you have a very early FT-51R? The
procedure is not described in my FT-51R manual but on a loose sheet that
came with it, so maybe it was a version add-on? Does your Tone Squelch
work otherwise?

2966. Radio Shack Digital SWR Meter

Newsgroup: rec.radio.amateur.equipment

Source record: 200632

Has anyone seen any comments about the digital SWR/Power meter for HF use? I was one of the engineers at Tandy that worked on this and I haven't seen any comments since it hit the market. I would have thought by now that Radio Shack would have had the sense to make at least one press release or give/loan a unit to one of the ham magazines for review. Actually, maybe my question should be "Has anyone even heard of this meter?". Even the latest flyer from RS is describing the meter incorrectly since it's actually usable down to 1.8 MHz, not 3 MHz as described. I would appreciate any comments, good or bad. We had to bend over backwards to redesign this to meet Radio Shack's changing requirements and it would be nice to know if anyone likes the meter.

This is exactly what happened to a person on CompuServe HamNet! He bought the early, flawed software at Dayton from the manufacturer of the Yaesu interfaces. There is not a fixed version.

It is my hope that you can restore full tx coverage via the MARS mod that many people already have. In other words, download the flawed code to restore the extra rx regions, get the MARS mod to get the full tx ranges, and then proceed to program your memories. (Memories are lost when loading the flawed program.)

Once you're on a freq with your tone decoder enabled and the tone-freq display showing one of the PL freqs, hit an arrow and the FT-51R will proceed to search for the correct one. Naturally, the radio will only find the correct freq while there are transmissions on the freq.

Yes, there must be a signal present that has a valid CTSS tone for it to find it, but that is not the problem here because that would cause it to search forever instead of stopping when you release the button. The symptoms you describe are what happens if tone squelch is set off. Are you sure you have it on (there should be a "T SQ" displayed directly above the frequency display for the band you are working with).

It's a current model, and the instructions for ATS (such as they are) were
included in the manual. Tone squelch is not common around here, so finding
a test signal is tough, and I can't answer if it's working properly
otherwise.

The antenna's come with their own glue. They generally hold quite well. I
believe the way to remove them is to apply heat.

My transceiver has an audio notch fiter built in, as well as a 400 Hz crystal filter. I also use an Autek Research QF-1A on the rare occasion that additional CW filtering is needed. Would the RS DSP provide any significant advantage for CW work? The Autek is very effective at "peaking" the incoming signal, but the ringing that occurs when it's narrowed down can be a problem, particularly when the band is noisy.

Jack I've used the Radio shack DSP unit with my Yaesu FT-ONE. My rig also has audio peaking and notching but the RS unit works faster and a bit better when it comes to hetrodynes. As for the other operations of this DSP unit, My rig doesn't seem to need them. Overall, I'd say the Radio Shack unit is an excellent buy!

Source record: 200655

Joel: I have both the radios and like them both. A few points that may help you decide:
T7A has tone scan which is real nice when traveling. It also has a remarkably long-lived battery, easy pocketability, and nice sounding audio. It seems rather poor at intermod rejection, is not as sensitive on the airband or the 400 MHZ utility band.
The FT50 is supersensitive, has tremendous and very useable out of band coverage, and decent battery life. It has a battery meter which I like a lot, but has a non-BNC connector which is a bit of a hassle. It is so rugged that I believe it will stand up to really rough use better than the T7A
Both are excellent radios. You'll enjoy either. 73

I have one of the filters. I agree with Brett. On my Icom 735 it works great on hetordynes the CW filter compairs very well with my 250 Hz Xtal filter on the Icom and the noise reduction doesn't do much.

However, on my HW8 QRP Heath kit xciver it greatly reduces then noise.

Good luck

Doug, thanks for the information. A couple more questions:

1) Here in the UK we are allowed 400 watts output. I infer that with
this meter, in the 2000 watt range that any 400 watts indicated may be
+ or - 200 watts, ie anything from 200W to 600W. Is this right?

2) Can the unit record PEP?

3) What is the part number and the list price?

Regards,

It is the same connector and gender. However, the FT-50R standard
antenna has its connector recessed somewhat so that the outer shroud
extends inside the case of the radio. The standard does not, so it
looks a little funny. Seems to work, though. I wish one of the
independent manufacturers would do a shorter version of this antenna
including the recessed connector.

No overreaction, experience says when the FCC takes time to remind us of the rules, they are going to enforce them. They usually do not send out public notices for nothing. May be it will be a real high profile case that just shakes every one awake for a bit, lets us know they are still watching. We'll see what the next 30 to 60 days brings in rulings or cases.

Be careful of placement of the 2 meter 5/8 wave antenna. If too close to the 6 meter antenna, it can induce high power into the 2 meter front end. Keep the antenna about 4 feet or more apart.

From: jflowers@unlinfo.unl.edu
Message-ID: <4odrp2$hbm@crcnis3.unl.edu>
Source record: 200488

I am planning to use my FT-840 with the Ten-Tec 20m<>6m transverter kit. My FT-840 only TX's from 14.000-14.500. I wish to be able to use FM up in the 52-53 Mhz range, but I would need my 840 to transmit from 14.000-18.000Mhz to use the whole 6m band.

In short, how to I get out of band transmit on the Yeasu FT-840?

i think these are a similar animal to what i once i had to replace in a small mobile hf amp (yaesu]. mine were an srf type for hf and they are probably a proprietory device. i phoned motorola and had no luck''they couldn't release the information. What i ended up doing is making photocopies out of a motorla data book;;taking an educated guess at what might replace them. i narrowed down the search to a few possibilities. considerations were 1) npn or pnp 2] what usually drives this amp how much power does it usually see gg into the transistor 3] match up some of the motorola data book schematics with the units schematic and find any similarities. 4) how much gain does the amp usually provide check the specs on the amp 5) how much output does the amp usually put out etc. using this kind of methodology i came up with a few good subs in the mrf series namely the mrf 454 and mrf 412 and a few others . they all would have worked fine i think but i chose the mrf 412 because it was more rugged etc. if i was gg to spend that kind of money i might as well go ahead and lay out a few more bucks for the better type. ...if you would like''i could look up some subs for you if you can perhaps mail me info. i have a big computerized data base of semiconductors at work and i can research in my spare time ..iam good in callbook as ve3ab for several yrs now. 73s es gl earl...address = earlve3ab@igs.net

Well, yes and no. Generally, if your car has a clean DC power source,
i.e., no alternator whine when you plug into the cigarette lighter,
you can just use a piece if zip cord and a plug and socket from Rat
Shack. It won't look as pretty as a genuine Icom product, especially
if you are all thumbs when it comes to soldering wires (like me), but
it will cost much less.

Believe the Yeasu does have crossband repeat.

I've owned the Kenwood and the Yeasu FT51-R and believe the Yeasu was
nicer to operate and use. Seemed easier to program as well.

The other import point for me was the better RF rejection of the Yeasu.
Took both radios to a high rf area and the Yeasu was the only one that
didn't constantly open squelch and blast out digital junk.

That aside, I'm sure any of the radios would be great.

>We'll see what the next 30 to 60 days brings in rulings or cases.

The underlying issue here is that the market for Japanese-produced HF
equipment is a worldwide one, and different countries have different
rules, different band-plans, etc. Realistically, the manufacturers
have to engineer a design that is easily adaptable to different
regions. In some areas of the world, amateur HF gear is used in
preference to commercial equipment simply because it's cheaper. This
is also a market that the manufacturers need to take into account.

Personally, I think this is much ado about nothing, unless there are
major high-profile cases of abuse that haven't been
publicized. Furthermore, this type of regulation is a losing battle;
witness the fact that, while Motorola commercial HTs are theoretically
not user-programmable, anyone who really wants to can get them
reprogrammed to any frequencies the unit covers.

Ignition noise increases at higher engine output, consistent
with going uphill. To suppress ignition noise, cover the sparkplug
wires with tubular copper braid, grounded to the block. Ignition
noises usually are a popping sound.

A discriminator usually consists of a transformer and two diodes
located at the end of the IF strip. This is not the only way to
detect FM though, so your receiver may not have one.

I bought a Yaesu FT-50R dual band HT last week
and added the FTT-12 CTCSS/DCS tone decoder option.

In general, I use an HT as a scanner outside the ham bands at
least often I talk with it in a ham band. The FT-50R is better
than most of the older model HTs for this job. Still,
it's not as fast or flexible as some scanners.

It scans memory channels in the conventional sense
and boasts 3 search banks. Memory channels can be
locked out from the scan, but there are no search
banks, as one finds in a conventional scanner. I measured
the scan speed at about 10 channels/second.

The receive frequency coverage is generous but it won't
cover the VHF-low band.

The FTT-12 option affords DCS (digital coded squelch)
decoding which no conventional scanner offers. Although most
public safety transmitters employ CTCSS (analog encoding),
a nearby police agency uses DCS and there's other chatter
on the same channel from competing users.
Having a DCS decoder lets me listen to the locals
without stopping the scan on the unwanted traffic.

Haven't measured the SINAD sensitivity yet because I'm
still awaiting the proper cable to plug into the
headphone/earphone jack.

Haven't heard any intermod during the past 3 road trips,
but that's not a thorough test.

Hello Folks -

I hope I'm not covering too much old ground, but, can
anyone give me some pro's and con's of the IC-706. Any articles
and reeviews would be greatly appreciated. Can anyone reccommned
a good place to purchase one. I'm in the Boston area. Mail oreder
would be fine.

Thnaks !

3027. Re: FT-50r Scanning: Opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-28 00:00:00 UTC
From: Gary Wilburn <ni8k@one.net>
Message-ID: <31AB40CC.605@one.net>
Source record: 200514

Rob:
Have a FT-50r and it does a good job as a scanner. Some of the features I like:
- scans at 45 channels per second (according to Yaesu at Dayton)
- receive audio is excellent compared to any HT. Very little background hiss while scanning using an earphone.
- can scan 5 diffrent frequency ranges. One at a time.
- can scan all 100 channels in memory plus has a "skip channel feature".
- can change scan direction by turning main knob up or down.
- will scan - stop then resume or can scan and stay on channel as long as there is a carrier. Seems to have a small delay built in also.
- while scanning if you hit a carrier you have the option of having the 50R beep or not beep plus turn on the disply light if desired.
- have not noticed any intermod problems - at least not yet.
- sensitivity equal to or better than my BC3000 and AOR 8000 and better than my IC-W21A
- According to Yaesu on receive with the standard 9.6v / 600mah battery - it should last a long time due to low power consumption on receive and battery saving features. All I can say is that the battery life is excellent compared to any other HT I have had in the past.

If you have 50 or so non ham band favorite frequencies above 76 mhz the FT-50R should do a good job as a back up scanner or a primary scanner if your not too critical or spoiled from using a BC3000 or similar dedicated scanner.

>Yes/ No?
>reply to email please..
>baack@midcoast.com
>http://www.umecut.maine.edu/~baack
>
Yes! Its a steal for $39. The cw narrow filter is nice and the SSB
works great on heterodynes. The key to making this unit work is setting
up the AF on your rig and the DSP correctly. There will be some hiss
caused by the DSP, but for 39 bucks what do you want?

The Repeater Directory I have lists the CTCSS by Letter code rather than the
so I assume thats why Radio Shack lists it in their manual.

3033. LOUD Astron PS??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-28 00:00:00 UTC
From: boardman@cobra.unm.edu
Message-ID: <4ofsgn$ko6@lynx.unm.edu>
Source record: 200520

I recently picked up an Astron 20 amp PS at a local swap meet, and I have some questions for other Astron owners. I checked the voltage, and it checked out OK, but when I hooked it up at home and keyed up a rig that draws 8 amps or so, the PS went from quiet (no load) to making a VERY loud 60hz hum when the current draw went up. I mean loud enough to hear at the other end of the house! People I talked to also heard a 60 hz hum. At first I thought they were just hearing the audio hum, but after getting far enough away from the PS so that the hum wasn't so loud, they still could hear it on my signal. Is this normal for Astron supplies, or did I just end up with one that has a problem?

[...]

Well, I tried this with my unmodified IC-706, using an Alinco DJ-580 with an Anli rubber-dummy-load antenna as a "probe". (I didn't bother disconnecting the J-pole antenna from the IC-706, as I figured if it was putting out any significant signal that way, I should be able to pick it up with the DJ-580.

After I remembered to turn off tone squelch on the DJ-580, :-), I found that I had to have the antenna within about an inch of the IC-706 to pick up the interference. I confirmed that the "interference" was coming from the IC-706 by cycling power on it, and noticing that the interference went away with the 706 off, and came back as soon as the 706 was powered on again. I tried this with the 706 in all modes. I noticed that the interference was present in all modes _except_ wide-band FM, where it disappeared as completely as when the 706 was turned off.

As a further test, I installed the separation cable, and placed the front panel on the floor about three feet from the radio. In this case, the DJ-580 had to be about 5 feet from any portion of the IC-706 for the interference to be completely undetectable. Again, the signal was present in all modes on the IC-706 _except_ wide-band FM.

All tests were done with squelch "wide open" (i.e., hearing the background hash) on the DJ-580.

3035. TS-50S / IC-706 / DX-70 / TS-900

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-28 00:00:00 UTC
From: Peter Barville <peter@barville.demon.co.uk>
Message-ID: <Viq8wAAPr3qxEw9R@barville.demon.co.uk>
Source record: 200522

I have used my TS-50S for hf mobile for quite some while now, and am very pleased with the excellent reports I receive, particularly on the transmit audio quality. The main criticism I have of the TS-50S concerns the ineffectual nature of its noise blanker.

I am attracted by the idea of replacing the TS-50S with one of the later rigs, with detachable front panel. There have been recent postings comparing these different rigs, and (as I recall) opinion seems to be that the receive performance of the rigs vary considerably. I think it was suggested that the TS-50S is the worst, followed by the IC-706, then the DX-70, with the FT-900 having the best rx.

I wonder whether anybody would care to offer any comments about the relative performance of each rig (and their noise blankers)? The IC-706 certainly offers plenty of facilities, but does it offer satisfactory performance?

By the way, I use Pro-Am mono-band whips (40m - 17m) and find their performance very good indeed.
73 - and thanks

3036. 70 MHz Amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-28 00:00:00 UTC
From: Matt Bohn <bohn@unm.edu>
Message-ID: <31AAAF3B.3009@unm.edu>
Source record: 200523

Hello,

I am a physics graduate student and I need a 100 Watt, 70 MHz amplifier. I currently have 20 Watts at 70 MHz. I was looking into building this myself, but the publications from ARRL show some rather bizarre design features. Would this be a difficult item to build? (Can you reference circuit designs?) Or is it possible to purchase something like this? I realize this is not a Ham frequency.

The output impedance will be coaxial to terminate into 50 ohms. It is a single frequency and not modulated.

The application is to modulate a pockel cell for a laser.

Thanks for any help.

Matt

I think you meant to say that the FTT-12 option affords you CTCSS decode.
My radio when it came with the standard keypad DECODED DCS (DPL) already.

I agree its one of the best multi use radios around.

>Does anyone have any mod's for this handheld?
++++III. MARS/CAP Modification provided by Mike Musick,
N0QBF++Here
is the MARS/CAP modification for the new Kenwood TH-79Adual-band HT.
Usual disclaimers about doing mods apply.1. Remove battery.2. Open
case by first removing 3 screws (#00 Phillips) on backand 1 screw on
side hidden underneath the rubber flap coveringthe DC power jack.
Gently pry apart starting at top; BNCconnector will move with back,
knobs with front.3. Spread unit out. Wires will "hinge" on the side
with the PTTbutton.4. Looking on the back of the keypad (front) half,
locate greenwire on upper left, just below the CTCSS decoder module.5.
Neatly cut this green wire, and tuck back in so ends won'ttouch each
other or other components.6. Reassemble.Programmed memory will be lost
since the CPU will notice thestrap change and reset itself.End result
- Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995 After: VHF RX -
118.000-173.995 TX - 142.000-151.995 UHF RX -
420.000-449.995 TX - 420.000-449.995Automatic repeater offset and
shift selections remain normal.And this tip comes from Duane Voth,
KC5BGV..."The MARS/CAP mod can be made without opening the entire case
up. You can fairly easily cut the green wire by simply (and
carefully) removing the CTCSS decoder cover and using a small pair of
diagonal wire cutters."
++
IV. "Wide Band" Modification, provided by Cole Cunningham,
AA7RD++Following
is a modification for the Kenwood TH-79A Dual Band HT whichopens it up
to tuning from 67-174 MHz and 400-511 MHz. Actual receive was
85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvoltor
better) sensitivity at all the points I measured. Transmit was
136-179.995 and 400-511 with power dropping off at the ends but
stillusable (about 0.5w on the high scale at the band edges).As usual,
I take no responsibility for the mods, or your use of the unit after
mod. Please exercise good judgement and don't endanger our ham bands
with your irresponsible actions.The observations noted are all I tried
and I have no further data.This is such a delicate operation that one
shot was all I wanted to do,and when it worked I
quit!!!WARNING-CAUTION-LOOKOUT-ETC!!!The diodes to be moved are
microscopic!! About 1mm long by 0.5mm wide.This mod should be done by
professionals on a closed track only.Children, do not attempt this at
home. Requires extremely small soldering tools and MUCH skill. I had
a professional surface mount facility do mine...1. Open the unit by

removing three screws from the back and one under the DC power input cover. Carefully separate the front and back pieces. The two case halves may be disconnected by pulling the wired plug and by prying the brown latch on the ribbon cable connector up enough to release it.2. On the front PC board in the lower right corner as viewed from the rear with the knobs pointing up there are seven spots for diodes in a row, with one diode missing. |
o o o o x o o | _____|
2 3 4 5 6 7 8 The numbers are D302-D308, left to right, with D306 missing.3. Remove D304, and D307. Put them away in a safe place (Just in case...)_4. You should now have:
| o o x o x x o |
_____| 2 3 4 5 6 7 85. Reassemble and good Luck.Enjoy, but don't create problems with the new capability...Wouldn't it be nice if Kenwood would make a RX only mod with these capabilities and we wouldn't have to worry about accidental transmissions where we shouldn't be transmitting. I, for one, don't want or need to TX, just RX...73, Cole, AA7RDAugust 11, 1994(Note - This mod also adds 2 more menu settings. One of which is an AM/FM demod selector for the 300-400 Mhz band. To access this band, select the VHF band, press F, then press the Low/Hi key. Repeat to return to 144 Mhz. The AM/FM selector will allow you to listen to Military transmissions in the 300Mhz band in either AM or FM. -

3050. Looking for ultra-compact HF xceiver

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-29 00:00:00 UTC
From: bvarley@yarrow.wt.com.au
Message-ID: <4of1gu$d7f@yarrow.wt.com.au>
Source record: 200537

I am looking for the most compact possible HF SSB set, for backpacking into remote areas. Needs to have sufficient power for moderately reliable communication up to several hundred Km. Full band coverage not required, but one good day and one good night band would be beneficial. Envisage using wire antenna such as a halfwave dipole.

Not sure of protocol on this newsgroup, but in case it helps I have a current Australian certificate of proficiency for full HF/VHF working. Due to lack of activity my callsign has lapsed.

Appreciate if someone could direct me to a source.

3051. Yaesu trade in

Message-ID: <4og6aq$llc@elmo.cadvision.com>
Source record: 200538

Yaesu is offering 150 bucks for old rigs.
I will too, plus I'll pay shipping.
Yaesu is giving a voucher, to be used within 6 months.
I'm giving cash, good for ever.(untill you spend it)
You pay shipping to Yeasu.
I pay shipping.

I have a couple of boys that want to get into Dads hobby, so I thought
if anyone has a rig they wanted to get rid of, to a good cause, for Cheap!
I could make them work it off doing yard work HI HI.

I know it's a real low price, and I don't expect any offers, but if Yeasu
is offering this ammount, who am I to argue.

Yaesu can be reached at; WWW.YAESU.COM
check it out if you have a rig to get rid of.
Then come back and read this again.

> ....

I like the FT50R, too, but mine scans much more slowly.
It scans memories at 10 channels per second, under
these conditions:

18 channels in scan list
6 of those channels had CTCSS decoder bit set
1 channel had DCS decoder bit set
channels 1 - 23 programmed
5 channels with Skip bit set

I've measured the scan rates on several scanners and ham
radios and find that often

1) the scan rate is lower than the manufacturer's claims
2) the manufacturer's specifies an impractical
"maximum scan rate", instead of a typical scan rate.

I have an old one-channel Concord Transceiver model TG-093. It takes a single 9-V battery, has crystals for ch.9, specs inside case give freq. as '27MC Band'. Made in Japan

It has an external power connector, push-to-talk, volume and a small threaded socket for an antenna- is there a standard single-contact connector about a quarter inch?

With a metal case, bakelite circuit board, and metal can transistors, I'd be interested in knowing how old this is, and if anybody has a compatible antenna or an adapter to fit the standard 'whip'.

3056. Sales tax at hamfests?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-29 00:00:00 UTC
From: Lee Blaske <lblaske@pclink.com>
Message-ID: <51c7cc$1719f.169@news.pclink.com>
Source record: 200543

I'm on the committee for the largest hamfest in Minnesota. In the past few years, we've been having a lot of difficulty attracting any retailers from outside Minnesota. The reason is because the Minnesota Department of Revenue has been getting really aggressive about sales tax collection. I'm not talking about collecting sales tax at the show; I think most above board dealers will do this whenever they attend a show outside their state.

The problem for us is that the Minnesota Department of Revenue considers anyone who attends a hamfest in Minnesota as having established a "retail presence" in our state. After attending a hamfest in Minnesota, a retailer from a different state is required to collect Minnesota sales tax on all mail order purchases from people in Minnesota.

Needless to say, for retailers who do a lot of mail order business, there is an extreme disincentive to ever come to Minnesota. Since a lot of hams use mail order to avoid sales tax, having to collect the tax would hurt business. Of course, all Minnesota residents are supposed to send in use tax whenever they purchase anything from outside the state, but few people do. The state would rather nail out of state retailers than Minnesota residents. I guess it's the popular thing to do, but it really hurts the state when it comes to trade/hobby shows like hamfests. It's pretty shortsighted.

We used to have a lot of out of state retailers at our show before the tax people cracked down on them. AES, for instance, has attended our show in the past, but will no longer come.

Anyway, I've been waging a letter writing campaign to try to change things. I don't know how far I'll get, but it can't hurt to try.

I'd really appreciate getting information from those of you reading this on your respective states handle the sales tax issue. Do your departments of revenue sock it to out of state retailers, or isn't it a problem? How aggressive is your state when it comes to collecting use tax on mail order purchases?

Any information would be helpful.

>Thanks & 73... Mark AA7TA

What you've got is a Motorola transistor that was a
"special". SRF's usually have a standard counterpart
(such as an MRF455 in the case of an HF power
transistor) but were house-marked for a particular
company's application due to a special requirement.
They may be graded for a certain beta range or, more
likely in your case, for having more tightly controlled
UHF parameters than a standard MRF part would have from
any given lot.

Sometimes, companies have parts specially marked just
to discourage copycats. The silly part is that
these special parts often have the Motorola "bug"
printed right on the top (although Motorola probably
won't release the actual cross reference information
for one of their customer's source control drawings).
WHat you might do is get hold of an old Motorola RF
Devices handbook and just do some detective work.

You probably know the output power and frequency range
of the device; you know or can measure the Vcc (and
double it to put you in the ballpark of the proper Vcex
ratings for a Class-C UHF power amp). THe case type is
obtainable by simple observation and comparison to
what's in the catalog.With this info, you can generally
cross-reference the device to a standard part with a
minimum amount of trouble and with a high degree of
certainty.

Hope this helps!

Message-ID: <4ogot5$3mr@golden.ncw.net>
Source record: 200549

Hello, anyone happen to have a schematic handy for a Regency MX 7000
that can tell me a handy spot to tap into the wideband FM IF? I am
trying to use an Icom 751 to monitor the IF to demodulate the SSB
signals on VHF-Mostlly 6 meters. The 455Khz IF works great, just too
narrow to move the Icoms VFO around more than 10Khz on each side of
the IF center. Seems like the wideband IF would be alot better for
this purpose. I have a circuit for sampling the IF without loading it
down that is good to +25Mhz. Anyways, I brought the IF out thru the
back of the scanner with an RCA jack and it works pretty decent.
Anyone give me a hand?
Thanks very much for reading!

This IS an amateur frequency and if you want to purchase such an amplifier ready made, call BNOS, Geat Dunmow Essex, 01371-856681, or call their distributor, Lowe 01629-580800. I believe that the model number used to be CLP70-10-100, but this may have changed in the past 3 years.

>email: bohn@unm.edu

Oh, but it is a Ham frequency, in the UK! We have an allocation from
70.0MHz to 70.5MHz. This means that there are several PA designs and
kits available in the UK for this band.

There is a design for a 100W 70MHz PA in the RSGB's VHF Manual, which
you can probably get through the ARRL.

I could dig out the names and addresses of some UK companies selling
kits for 70MHz PAs, but unfortunately I am at work, and my 'library'
is at home! If you would like me to do so, please Email me.

As a footnote, I believe that there are moves afoot to get a 70MHz
allocation for more countries (in Europe at least), though with the
speed at which these things work, it'll probably be well into the next
century before this happens!

73 de Ian, G0TCD.

You could make sure that your ground for your antenna, and ground are the same (no big ohm difference). Also you could make sure ground strap wire,

which is the braided wire, from engine to car body is tight and making good connection. With car running unpug the antenna and see if it goes away.

Consider the Ten-Tec Scout 555. It has a good receiver, 50W
out, and a very low price. It can be operated for a long time
from a moderate battery and incorporates a SWR meter.
Several hams reported good results with it.

I have a Yaesu FT51R, and an Icom IC-T7A. (Also an Icom IC-T22A, but it's not
a dual-bander). I wasn't too fired up about the modern styling of the T7A,
but over a few weeks it dosen't look quite so futuristic; I like it now...

I carry the T7A because it is MUCH smaller than the 51R, if both radios have
the 12-volt packs... the Yaesu is small with the smaller battery pack, but
you can't get 5 watts out of it then. The Icom just gets heavier, not
larger. If you don't neet 5W, use the battery that comes with it (gives you
3W) and it is SO LIGHT!

A voltage meter comes on for a few seconds when you power up the radio. The
Yaesu can be displayed continuously.

Both have AM air RX. Icom has (4) sets of programmable scan pairs, and built
in pairs (all 144, all 440).

I wish the T7A had alphanumeric display (like the T22A), but I use the
memories to compensate (10's for local police zones 1-13 (Chicago) 20's for
2-meter, 40's for 440, 50's and 60's for travelling). Bar far the most
simple radio I have ever owned to program. Both the Yeasu and Icom offer
programming software (Yaesu is Windows and really nice, Icom is DOS and not
as pretty, but functional.

I find the sliding lock switch kind of strange, but I don't use wide
variety of lock combinations... only PTT, PTT and freq, more
combinations than I care to go into.

My Icom accessories (HM-46 mike (I REALLY like this mike, small and TOUGH...
the plug is short so there's not a lot of leverage on the jack, the HUGE plug
on the Yaesu display mike scares the crap out of me) and the headset) work
with my T22A, and worked with my 2-SAT... nice not to have to buy all new
stuff for each radio.

The T7A has an automatic squelch (that can be adjusted, but seems to work
quite nicely, so I haven't had to), and a volume KNOB instead of the
up/down

buttons of the Yeasu FT51R... personal preference, but it seems like the steps on the buttons are just a little above or below what I want.

The tone scan feature is nice... I can use it on RX of public service (police, fire) and see the PL tone (like I have any use for that info...).

You can only use one band at a time with the Icom, but I hardly ever used the
dual RX in the Yaesu anyway. No "function" key, the keys have two uses depending on whether you press and release, or press and hold before releasing.

My only gripes are: No alphanumeric, and the case has a cutout to let you use
the sliding lock switch, and stuff gets in through that cutout, kind of defeats the purpose... I just use the case from the T22A - no cutout. The T22A and the T7A use the same batteries, too. BONUS! Hope Icom makes this a
standard battery for a while.

The Yaesu has a really nice display, alphanumerics, on-board help (Icom has
on-board help displays too... I don't understand why no user-programmed alphanumerics), a lighted keypad, and a really trick lighted display mike, with freq readout, and remote control. The Yaesu has been a good radio, but
the Icom seems to be more in a smaller package.

I'm selling my FT50R to my brother this weekend... does that help? :-)

>John
>KC7MRY

Hi John. Looking at the Motorola model number - -T83RTA1404BA - - The "8" tells us that it is a high power radio - - 110 watts. The "3" is the frequency range - - 146 to 174 mHz. The "1" designates carrier squelch (no PL), and the "4" means that it is a four channel unit. I don't have a manual, but this will at least tell you what you have.

schmooze@msn.com (Ariel Maiselman) writes:

-What do you think Radio Shack stands for?
-Needless Markup"""""""""""
-If i were you, I would'nt touch the place, i purchased htx 202 2
-meter fm Broke 5 x's and still not opperating, then i bought a
-voltage meter, it was about a week to break, they said it was faulty,
-from the manufacture, who's the manufacture?? Any over sea's Company
-that is willing to sell their wares, specially when their inferior
-quality""""""""""""" That's Radio Shack"""""""

How many times did you take it in for repair? Why didn't you ask for
a new one? I worked for Radio Shack part-time off and on for about
fifteen years. I never understood why people would buy something
and bring it back several months later saying that it never worked and
expected to have it fixed for free. Why didn't they bring it
back the day it stopped working? (or shortly thereafter) Radio Shack
is generous to a fault when it comes to equipment that is "bad out of
the box." They are always more than happy to replace the faulty
equipment. If your volt meter took a week to break did you take
it back for a replacement? If you did and the problem was with the
volt meter and not caused by abuse or accidental damage they would
have replaced it with a smile. I still have the FIRST DVM that
Radio Shack ever sold. It is over fifteen years old and still
works fine. I have some of their stereo equipment that is more
than twenty-five years old that works better than most of the
newer digital stuff. Sounds like someone dropped the ball
on this one. From your attitude it sounds like it was you. I have
never had a bad experience at Radio Shack where either the store
manager or district manager didn't fix the problem to MY satisfaction.
I purchased one of the first HTX-202 rigs. It was one of the those
with a design flaw that caused the zener regulator to fail because it
was mounted too close to the final transistor. It was fixed and
modified at no charge to me. Granted Radio Shack tends to skimp
on features to keep the cost down and the markup up but the don't
skimp on the quality of the features they do include. However,
as with any company they do occasionally produce a lemon.
The DSP-40 is excellent piece of equipment for $80 and really
great for $40! The only shortcoming that it has no noise filter.
As a narrow CW filter it is excellent. As a heterodyne eliminator
it is excellent. What can you expect for $80? The next closest DSP
is one by Timewave for $150. What's the difference? The Timewave
unit has a noise filter. You may find that the attitude of the Radio
Shack personnel and their willingness to help depends on the attitude
of the customer. If you walk in and slam the merchandise on the

counter you the Radio Shack people are much less likely to bend
over backwards to help you.

From: rlubash@poco.mv.com
Message-ID: <Ds6ADI.1wu@mv.mv.com>
Source record: 200571

I have been using an older PK-232MBX for RTTY I have tried a friends tnc for pactor and would like to use that mode also.

I have the option of upgrading the firmware on the PK232MBX and getting pactor software or selling it and getting a DSP-232 that comes with software. I would like to know if anyone has had experience with the DSP-232 on RTTY and if it works noticably better on poor signals, QRM and other adverse band conditions. I don't mind spending the extra money but would want it to be an improvement over my old PK-232.

Thanks in advance

3086. Another Ramsey kit to avoid

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-29 00:00:00 UTC
From: n1ist@netcom.com
Message-ID: <n1istDs68Gx.5E5@netcom.com>
Source record: 200573
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Looks like I fell for it again, and bought another Ramsey kit (when will I learn :-)

I picked up the FM-6 "Crystal Control Micro Size FM Transmitter Kit", hoping to use it as a Fox transmitter. It seems that enough calls were made to get them to use a crystal other than one for *144.0* MHz; now it is supposed to be on 146.565 MHz (the Fox frequency) +- 50KHz; mine is right on the 146.64 Waltham repeater's output, among others.

This is a surface-mount kit with a varactor-tuned crystal oscillator around 12 MHz followed by a quadrupler and a tripler to get to 2M. What it *doesn't* have is ANY filtering. I put it on the spectrum analyzer, and it is a very nice comb generator, with spurs every 12 MHz (including the aircraft band and FM broadcast band) These spurs (as well as the 2nd harmonic) are at most 5-10 dB down from the fundamental.

I called Ramsey, and their only response was "Look in the ARRL handbook and add a filter"; they will not take it back even though, if assembled correctly as per their instructions, it is *not* legal to use.

Also, this is advertized as a bug or surveilance transmitter, and not until the very end of the manual does it mention:
"The FM-6 operates in the 2 meter Amateur radio band and should be used by or under teh direction of a properly licensed ham operator."

So it looks like another Ramsey kit to avoid...

On the other hand, I am just finishing up the Ten Tec 2M kit; that's one very nice kit, and I would recommend Ten Tec kits to anyone who wants to get into kit building...

3093. Re: FT-50r Scanning: Opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-29 00:00:00 UTC
From: 73573.1504@compuserve.com
Message-ID: <4oi4kp$k8@nntpa.cb.att.com>
Source record: 200580
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner,alt.radio.scanner

I took my radio to the Indy 500 race this weekend and used it to access the Indianapolis repeater as well as using it as a scanner to listen to the pit crew/driver communications, race control, and broadcasters. Some of the things that I really liked about using the radio as a scanner are adequate scan speed, great audio, alphanumics to identify the channels, the ability to program the radio with the computer and save the information in a file, and the small size compared to a conventional scanner.

However, in an EMI hostile environment like a race track, I experienced a lot of interference from IMD's , bleedthrough etc. Most of the signals at the track are very strong (I was able to pick up a perfect signal from the track safety crews when I was 2 miles away from the track). My Bearcat 200XLT did not experience interference as badly as my FT-50 and my brother-in-laws Realistic scanner did not experience any interference (not sure of the model number, may have been a triple conversion scanner). A friend suggested that the next time that I take the radio to a race to take along a collection of SMA inline attenuators to put between the antenna and the receiver. I believe that this will solve the problem.

By the way, this would have been a perfect situation to utilize the advertised Wide FM receive that is advertised. I try to take along as little stuff as possible to the race and it is sometimes helpful to listen to the FM broadcast to keep track of the race. The other bug that I have found with the radio is that the receive icon in the LCD display does not come on when a signal is received. The instruction manual states that one can turn off the LED to save the battery and the icon will perform the same function, but it does not. I realize that this is a small complaint.

Overall, I am very pleased with the radio.

Body handling: Binary attachment payload not displayed: Sign2.jpg

Hi,

I have been given a Motorola PMR set and would like to know if anyone can tell me what it is?

It is a standard mobile size with a detatchable front panel, on the left side is the only rotary control for on/off/volume, it has a standard Motorola "Police Style" mike with a modular plug.

The centre of the set is a 12 digit LCD display with three groups of two buttons around it.

On the right hand side is a full numeric keypad, all buttons are illuminated.

The model number is MAU36EVA5G22BK and the Type is 36EVA5, the set was made in Germany.

Any ideas?

> ICOM itself, but can somebody tell me from which

Stefan:
I think Icom says here nothing was changed but the advertising <g>:

I wanted to know more about "the yellow wire mod" for the IC-706 (the "yellow wire mod" was advertised on the Internet as a means to improve the receive operation of the 706 outside the ham bands in the VHF range). Since I posted this, there has been a flurry of comments. Consensus seemed to be that doing the mod would not likely violate Part 15 emissions, but it
wasn't certified with the mod, so technically, it's illegal.

>>ICOM stopped advertising and actually changed the specifications for wide receive in July>>1995. The radio receive range is adver=
tised from 30 KHz to 120 MHz and 144 to 148 MHz, and>>it is only guaranteed with in the Amateur Bands. We are fully aware there was=

Forrest:
All of the data I've seen on Internet and magazines is true about the 706. It's well documented in terms of good points/bad points. I like it very much and researched prior to buying (check DejaNews for old articles from Usenet on "IC-706").

I have been collecting Hustler resonators and even making my own. My first night on 20 SSB brought-in Hawaii, first call, not bad. I've been into Europe and Central America with ease too. Dave Ingram's book on mobiling is a good resource for useful info (e.g., did you know you can use a Huster 15 M resonator with a longer 42" whip for 20?).

3103. Mobile Noise Help

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-29 00:00:00 UTC
From: csmith1@ccgate.hac.com
Message-ID: <4oic8d$gcc@newsroom.HITC.COM>
Source record: 200590
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I've grounded the HF rig with heavy braid, direct-connected to battery with No. 10 wire, and grounded the hood, engine (2 places) and exhaust pipe to the body and/or frame. The antenna is mounted on a well-grounded plate. Everything works great, except for a noise problem I can't seem to locate. I tried an alternator filter (heavy series coil and shunt cap) that didn't do anything--so, that, along with disconnecting the antenna making it go away makes me think it's radiated noise.

I get a rushing hash (like white noise) only when the engine is under load. It is enough to wipe-out weaker stations, but not those louder ones. I throw in the clutch and it goes away, even if I then race the engine (leads me to think it's not ignition, but some sender unit--perhaps fuel injection electronics radiate only under load?).

What device or other cause might do this? I'd like some help before trial and error decoupling whatever I find under the hood <g>)

> TNX de Andy, KB0JSU
I dont know if the mods for my rig the ft-890 are the same as for the 840 but
I checked up on the ten-tec and here is what I found. The transverter will
transmit from 50-52 upconverting 14-16, The unit will receive 50-54 unconverting
14-18, 8 watts maybe 10 fdrom 5 input. also most of the sb and cw actitivy is
the lower part of 50-51 mhz so dont hesitate to use just the lowest 500 khz, as
that will do you 95% of the time. Check with webcrawler and run a keywork search
for ft-840 and you should be able to find the page I seemed to have misplaced...

As far as I know there are NO after market antennas yet available.

The Yaesu SMA connector is NOT compatiable with the Standard type SMA.

Source record: 200596

I have a Yaesu FT51R, and an Icom IC-T7A. (Also an Icom IC-T22A, but it's not a dual-bander). I wasn't too fired up about the modern styling of the T7A, but over a few weeks it dosen't look quite so futuristic; I like it now...

I carry the T7A because it is MUCH smaller than the 51R, if both radios have the 12-volt packs... the Yaesu is small with the smaller battery pack, but you can't get 5 watts out of it then. The Icom just gets heavier, not larger. If you don't neet 5W, use the battery that comes with it (gives you 3W) and it is SO LIGHT!

A voltage meter comes on for a few seconds when you power up the radio. The Yaesu can be displayed continuously.

Both have AM air RX. Icom has (4) sets of programmable scan pairs, and built in pairs (all 144, all 440).

I wish the T7A had alphanumeric display (like the T22A), but I use the memories to compensate (10's for local police zones 1-13 (Chicago) 20's for 2-meter, 40's for 440, 50's and 60's for travelling). Bar far the most simple radio I have ever owned to program. Both the Yeasu and Icom offer programming software (Yaesu is Windows and really nice, Icom is DOS and not as pretty, but functional.

I find the sliding lock switch kind of strange, but I don' wide variety of lock combinations... only PTT, PTT and freq, more combinations than I care to go into.

My Icom accessories (HM-46 mike (I REALLY like this mike, small and TOUGH... the plug is short so there's not a lot of leverage on the jack, the HUGE plug on the Yaesu display mike scares the crap out of me) and the headset) work with my T22A, and worked with my 2-SAT... nice not to have to buy all new stuff for each radio.

The T7A has an automatic squelch (that can be adjusted, but seems to work quite nicely, so I haven't had to), and a volume KNOB instead of the up/down buttons of the Yeasu FT51R... personal preference, but it seems like the steps on the buttons are just a little above or below what I want.

The tone scan feature is nice... I can use it on RX of public service (police, fire) and see the PL tone (like I have any use for that info...).

You can only use one band at a time with the Icom, but I hardly ever used the dual RX in the Yaesu anyway. No "function" key, the keys have two uses depending on whether you press and release, or press and hold before releasing.

My only gripes are: No alphanumeric, and the case has a cutout to let you use the sliding lock switch, and stuff gets in through that cutout, kind of defeats the purpose... I just use the case from the T22A - no cutout. The T22A and the T7A use the same batteries, too. BONUS! Hope Icom makes this a standard battery for a while.

The Yaesu has a really nice display, alphanumerics, on-board help (Icom has on-board help displays too... I don't understand why no user-programmed alphanumerics), a lighted keypad, and a really trick lighted display mike, with freq readout, and remote control. The Yaesu has been a good radio, but the Icom seems to be more in a smaller package.

I'm selling my FT50R to my brother this weekend... does that help? :-)

I have the Radio Shack digital swr/power meter. I've only used it a few times with a 10M mobile rig. It seems to perform well. I have a Mighty Fine Junk 949C that I have been using for several years. I haven't noticed a significant difference between readings from one meter to the other, although, I haven't made a great effort to compare them, either. I've only had the Radio Shack meter for a very short time so I haven't really developed any strong opinion oneway or the other.

The 6146W is a ruggedized version of the original 6146 and 6146A, which were not designed with linear service in mind (i.e., developed before the days of SSB). The 6146B has a higher plate dissipation, and requires different biasing. What perceived benefit do you see, other than cost? I would not recommend it.

Good Luck!

I missed the original post, so I can only but guess what was said ...

If you are talking about mechanical noise, this is sometimes caused by the magnetic field of the transformer attracting the steel case, and causing it to vibrate (usually at the top rear of the cabinet, where it overlaps the vertical panel the heat sinks are located on.

Sometimes you can remove the top cover, "warp" it in an upward direction (bend it about 1/8 inch), and replace it to find that the contact (which is what causes the vibration) goes away ... sometimes a shim (I used a folded business card - if you want one of mine, let me know ;-)) in order to keep the two panels from contacting will do the trick.

With the amount of current flowing in the low voltage windings of the transformer, this sort of situation is not uncommon, particularly in the higher current supplies.

Good Luck - hope this helps!

Kenwood discontinued the TU7 several years ago, and they are no longer available.

If you need just one tone (or are willing to cut a hole in your radio to access a "Dip Switch" to change tones, a "generic" tone deck like the Communications Specialists SS-32P would work fine ... if you need access to more tones, an external, switchable unit like the Communications Specialists TE-32 would be more applicable. Let me know if you would like further information on either one.

Perhaps someone can help me identify some radios that were given to me
some years ago. There is one base unit model 239 0226-001/011/021
FCC DATA 242-8800.

Also a mobile unit, a 522 mobile model 0226A021A
According to my freq counter, the base unit transmits at 817.940 mhz
though it doesn't "like" my dummy load and trips out in a few secs..
Apparantly, from scanning around it may be a repeater input with an
output approx 45mhz higher..
Is it good for anything?? Could it be modified for 900mhz amateur use?
Or is it just a boat anchor that belongs at the junk store??
73s and thanks in advance for any assistance..

3116. Ameritron AL-80A(X) max currents?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-29 00:00:00 UTC
From: Ilkka Kontola <ilkka.kontola@nmp.nokia.com>
Message-ID: <31AC0677.2EE@nmp.nokia.com>
Source record: 200603

The previous owner of my Ameritron AL-80A(X) has not yet found
the users guide. In the mean time I would appreciate the
following information:

- maximum (operation) plate current for SSB, CW and RTTY?
- maximum (operation) grid current for SSB, CW and RTTY?
- maximum RTTY keydown duty cycle, time limits etc?
- for which line voltages there are provisions in the
primary of the transformer? (There is a label "240 V"
attached to the back panel. The local line voltage
seems to be around 230 V so the 240 V setting should
be enough on the safe side)

The plate voltage is about 2.9 to 3.0 kV unloaded and 2.5 to
2.6 kV with 400 mA plate current.

I have some experience with external anode tubes such as
4CX250B and 3CX800A7 but this is my first radiation cooled
tube. What is the apparent 3-500Z plate color when
the plate dissipation is at the nominal 500 W? (No, I am
NOT operating the amplifier without covers. The tube can
be seen thru the exhaust vent mesh)

Thank you for your time!

73,
Ilkka

Hello.

I am Igor. I live in Daugavpils, Latvia. Latvia is a small country
near Baltic sea (east Europe).
The digital radio communicatios are new for us. I have two problems
using digital radio links.

1. There are two establishments on distance approx. 1 km. In each
establishment working local network (Ethernet). How to connect
its using radio link? What max. baud rates I can get on 430MHz,
1240MHz ? What modems designed for that and what prices ?
What radio stations need for this targets (standart or special)?

2. How to made multiuser Internet access via radio. Not need high
speeds for that. I think about 9600 bps. What hard- and software
you can recommend ?

I am a novice in this things. I shall be glad to get any information.
By the way, if you a radio equipment dealer (better in Europe),
please write your prices...

Thank you.

THIS PROBABLY IS A STUPID QUESTION TO MANY OF YOU, BUT I WILL ASK ANYWAY. I
RECENTLY PURCHASED A FT736R AND LIKE IT VERY MUCH, WITH 2 EXCEPTIONS. ONE IS
THE POWER OUTPUT IS JUST TO LOW! I AM WONDERING IF THERE IS ANY WAY TO
PRODUCE
MORE OUTPUT POWER WITHOUT PURCHASING AN EXTERNAL AMPLIFIER. THE SECOND
EXCEPTION IS I CAN'T FIND A DESK MIKE WITH THE SAME AUDIO AS THE HAND MIKE. I

TRIED THE MD1C8 AND THE AUDIO AND TONE QUALITY WENT SOUTH. ANY IDEAS ON THESE

ITEMS WOULD BE APPRECIATED.

THANKS AND 73'S
AL COPP

>band that is 4 MHz wide!

Actually I believe this is all directed not at the amateur service,
but at those CBers who buy "10 meter" rigs and bootleg between
27.405 and 28.000 and also below 26.965.

Federal enforcement there seems to be nearly nil. They are doing
preemptive enforcement. What would be great and would certainly help
the situation would be to type accept 10 meter only gear. I know of
no ham that uses an RCI made radio on ten.

I too have had a problem with the Yaesu FT-736R on 70 cm xmt. Mine is a little different. In general, I would say the radio is minimally decoupled to external RF fields - and some of its own. I can say its what I have come to expect from Yaesu, but there;s no other radio out there that does what the '736R does. I find that the power output level is highly dependant on microphone cable placement. Its, I guess, another unadvertised way of controlling the power output on FM or SSB. I have used a clamp-on ferrite "bead" on the microphone cord to solve that problem.

In addition, when I got the radio, I discovered it was number than the usual Japanese radio. It NEEDS preamps on all bands!!!! I decided to be different and use the norbal +12vdc available on the reat DIN connector - not the provided switched power specifically for preamps. I wanted do something different with the radio. BAD DECISION! That power is not decoupled from the main regulators. It works fine in receive, but have a little stray RF around the shack and the regulators go bonkers!!! Rather than do the EMC engineering job Yaesu should have done - heaven knows, the radio isn't cheap - I opted to abandon my plan to do what I originally wanted to do with the radio - which now REQUIRES an external power supply - and use their power provided for the preamps.

I work as an EMC (electromagnetic compatibility) engineer. I can say professionally that the decoupling job done by Yaesu is INADEQUATE, even from a regulatory viewpoint regarding radiated emissions (while receiving - from the box in general). I can't monitor HF for weaker signals with the '736R on in the shack. The noise from the switching power supply is not adequately decoupled from the outside world! These issues are something the average amateur doesn't see when he (or she) lays down the big bucks for a fancy new radio. How do we make the manufacturers resopnsible to their obligation in the world marketpoace?

When in Dayton this past month, one of the guys set up near my buddy had a Saturn sedan (2dr). I was curious how to mount antennas on that car since the body is made of plastic.

This guy had a piece of angle-iron protruding from the frame out the side of the bumper. Had a 3/8 X 24 threaded post on it and was running an Outbacker Perth antenna with an Alinco DX70. Performance was fine. Rig was remote mounted (main part under passenger seat, control head mounted on-dash).

On the VHF side, he was using a trunk-mounted Comet 1/2 wave antenna (which required no counterpoise). Rig was an Icom 229A (25 watt) mounted under-dash on the passenger side of the car.

The installation was clean (xyl approved, I think he mumbled).

In article <4oksc5$c03@newsstand.cit.cornell.edu> cjs9@cornell.edu (Carl Steckler) writes:
-In article <n1istDs68Gx.5E5@netcom.com>, n1ist@netcom.com says...
->I picked up the FM-6 "Crystal Control Micro Size FM Transmitter Kit",
->hoping to use it as a Fox transmitter.
->
->This is a surface-mount kit with a varactor-tuned crystal oscillator around
->12 MHz followed by a quadrupler and a tripler to get to 2M. What it doesn't
->have is ANY filtering.
-Mike, I also looked at this kit in the catalog, you know what? there is no
-mention of filters. So what's the bitch? It is not as if they promised you
-filters and you didn't get them.

The ad doesn't mention any other part of the circuit either... What I
expected was a kit that, when built according to their instructions,
would be legal to use. This kit does NOT meet FCC harmonics requirements,
and transmits on frequencies that ARE NOT licensed for this purpose (FM
broadcast band, aircraft band, etc.) while also transmitting on the intended
frequency. The filter should have been included as part of a decent (or
just legal) design.

-They offer suggestions to try as in modifing the kits I have purchased.

Why should I have to modify a kit to get it to perform as described?

-Another thing, just what did you expect for what they were charging for this
-kit. Sounds like you want top of the line for little or nothing.

No, I just wanted a 2M transmitter without the hassle of designing one
myself. There is no reason that they couldn't have added filtering at
that price...

->On the other hand, I am just finishing up the Ten Tec 2M kit;
-How much more was the TenTec kit? Might there be a correlation?

Apples and oranges here... The Ten Tec kit is a full 2M transceiver,
and is priced comparably to the Ramsey FTX-146 (which, according to the
QST review, is also a kit of questionable performance and legality...)
On features, the Ten Tec 1220 beats the FTX-146 hands-down; it has a
full front panel, CTCSS, mike and mobile bracket, and place for an
internal 35W amp for about $20 more than the Ramsey.

: I too have been trying to find a stereo mx chip.
: Does anyone know of any more information... the web sites mentioned
: below were not much help.

The stereo multiplex generator chips I've heard of are both from more
obscure japanese companies. Rohm has the BA1404 (and a BA1405) and
NJR has the NJM2035.

The BA1404 is what is used in the Ramsey FM-10 and other "license free
broadcaster" kits. (It includes a transmitter section). There have been
articles on the FM-10 in Popular Electronics a couple of years ago and a
construction article on a BA1404 based transmitter in the July 1992
Radio-Electronics magazine. Also covered in Don Lancaster's "Hardware
Hacker" column in Radio-Electronics around that date.

The NJM2035 is what I've heard is used in the FX-Wave CD to radio
convertor that you can buy off the pegboard at your local discount
store. Last I knew, Digikey sells NJR but I didn't find the part
in the catalog I looked in.

Barry

I'm not sure and have not managed to find out from Yaesu, apart from the
fact that they are "engineers functions" used by Yaesu engineers.

But this is what I have found out

9-0 seems similar to item 8-9 it is labelled "car-set" but the settings
are differant to the ones in 8-9

9-1 is rx if gain -- just like another rf gain, you can turn it up and
give everyone a 59+ or turn it down and simulate receiving qrp .. hi

9-2 is tx if-gain? I haven't been brave enough to muck about with it

9-5 is a weird one .. if u move the vfo 1 all the rig lights come on and
if u press enter all the small segments do a magic impression of the
seige of venice .. dead usefull !!

9-6 turns the little tuning bar on for ssb, very neat, It seems to give
a good indication of audio or alc.

9-7 is a self check, with settings for time to tx, rx and change mode.
it looks like a sort of "burn in" method for the rig.

9-8 i think is the software/rom/whatever version for the radio, mine is
951207c2

9-9 is the settings for tx/rx and bands for all the differant markets, I
havent tried them all but suppose that some leave out differant parts of
different bands.

thats it

This is all guesswork (probably bad) so don't try them on my account.

if anyone can add/disagree or pass on their information, I would be interested.

Sometimes I even use it for transmitting ..

President Lincoln has been dead for an awful long time. The request for a
service manual on him is a waste of time.

We do need service manuals for President Clinton as well as Newt Gingrich
and Bob Dole. They all have major service problems. Clinton goes into
thermal runaway, Gingrich gets random glitches in his I/O port, and Dole's
clock is running real slow.

You have to hold down the UP/DOWN /the ones with arrows) while turning the radio on. The first time you do this, the radio enters the extended mode. The second time it does a full reset, so be careful.

======= response GM0CSZ/KN6WH
Bob , I have a 50 Amp Astron PSU and I can confirm it humms
badly,albeit at 50 Hz (living in Scotland) .I mean it's audiable hum
without any load being connected to the PSU. I think it is the
transformer sitting very near the steel enclosure. The
enclosure/transformer acts as a transducer.
The problem could be cured by using a toroid type of transformer (no
external electro-magnetic field) but these are expensive . Placing a
piece of rigid polystyrene foam between the transformer and the
enclosure walls/top reduces the hum somewhat . I intend trying a non
magnetic metal enclosure (aluminium ?) or wood with aluminium foil
on the inside for screening if this proves necessary. I'll keep this
forum informed about my efforts . In the meantime any other advice on
how to solve the hum problem is very much welcomed .

When in Anaheim CA last year , I visited the local HRO store (selling
Astron PSUs) where they had not come across serious hum problems ,
although I had the impression their response was somewhat 'sales protective'.

>comments. Consensus seemed to be that doing the mod would not likely
>violate Part 15 emissions, but it wasn't certified with the mod, so
>technically, it's illegal.

No, it's not illegal. It is the manufacturer who is required
to make the equipment comply with Part 15. The user is only
responsible for preventing harmful interference.

This is not the same as modifying equipment that is used in a
service that requires type acceptance. Even then, the user may
modify the equipment so long as the modifications A) do not change
the equipment characteristics beyond the rated limits established
by the manufacturer (and accepted by the Commission when type
acceptance is granted), and B) do not change the "type of equipment".
The exact nature of what constitutes a change in the type of
equipment is defined in F.C.C. rules and includes a number of
criteria. If Amateur gear was type accepted, the "yellow wire mod"
would violate this provision.

>>We will not modify nor embrace this " yellow wire " modification.
>>Doing this modification violates the FCC Part 15 Type Acceptance
>>of the radio. We can not legally do this modification. When you
>>clip the Yellow wire, you turn off a filter that is designed to
>>retain receiver radiation within the receiver,

This is just a sleazy way for the manufacturer to disclaim
responsibility for the ease with which the user can perform this
modification. It's similar to the now illegal ploy of selling a
"10 meter" amplifier to a CB'er with the disclaimer that it can't
be legally used on 11 meters.

If you're going to make CW a significant part of your operating,
QSK is highly recommended. There is no peer to Ten Tec in this
regard - they build the best CW rigs on the market. Your price
range would easily buy a used, "loaded" Corsair or Corsair II.

At a time when Japanese service and support seem to be waning,
Ten Tec continues to offer the best service and customer support
of any Amateur manufacturer. They also stock used gear (although
you may need to put your name on a mailing list) and they offer a
free trial period on every transceiver they sell.

Corvettes have the braided covers and shielded spark plug boots as
standard equipment. They also cover the entire distributor and coil
with a metal "doghouse". If the engine is a Chevy V8, you could
probably use those parts as-is.

If memory serves, the 242-8800 is the fleetcom 880 mobile...
Not sure about the 522....had limited experience with Johnson 800Mhz
radios....

BUT what you have with the LTR name on them is 800 Mhz trunked radios
(also called SMR for Specialized Mobile Radio)....they are set up for use
on 800Mhz rptrs that operate at 45 Mhz splits AND have autochannel select
for the units..

They cannot be easily converted to amateur use....the logic boards would
have to be bypassed and simple synthesizer controls added....or the
entire CPU reprogrammed with NEW software to allow it to work as a
conventional radio in the 900 Mhz amateur band...

SOMEONE may have done it,,,I have not heard of any..

I have a Cushcraft A4S multiband yagi antenna for sale.
This beam cost me over $400 a year ago. I will sell it
for $175.00 and I will pay shipping within the U.S.
You can email me at: rayf.gate.net or call 941-648-1223
Thanks, Ray

This is a hopeless situation. Many states already have laws and
agreements that define even mail order purchases as a retail
presence, and require collection of tax.

None of this will stop as long as those in government are allowed
to steal.

Howdy. I am wondering if anyone knows of a good audio
equalizer that is specifically designed for voice band
applications, i.e. 250 Hz to 4,000 Hz?

Any design ideas for building one will also be appreciated.
I am handy with a soldering iron, hi.

Actually, Yaesu is using two different kinds of SMA connectors on their
HTs, the one on the FT10/40 and the one on the FT50R. I believe that the
Standard antenna will work on the FT50, but not on the FT10/40.

Mike,

Have you called East Coast Transistor? They're the official parts outlet for Kenwood. How about calling JAN Crystal, International, or some other crystal maker? I'd estimate you could get one for about $10 from most makers, maybe a bit more for the Kenwood part.

BTW... if you decide the TH-21AT isn't worth fixing, I might be interested ib acquiring it as a spare parts source for my TH-21AT.

Jason,
I've found it a good buy at $49.00. I use it with my
FT-()! and FT-840 with good results even tho' both have narrow
CW filters. It is quite good on SSB as well, really gets rid
of the tuner-uppers, those annoying hetrodynes.
I use in front of my TNC as well on HF and find it effective.
Only weakness is noise blanker is not too effective.
BTW, it really shines with my National NC-300
I use as a VHF/UHF IF.
Id buy another if I could find it....

Mike, I also looked at this kit in the catalog, you know what? there is no mention of filters. So what's the bitch? It is not as if they promised you filters and you didn't get them.
>
>I called Ramsey, and their only response was "Look in the ARRL handbook and
>add a filter"; they will not take it back even though, if assembled
correctly
>as per their instructions, it is *not* legal to use.

Again I find this is exactly opposite whit every contact I have had with Ransey. They have always been polite and very helpful. They offer suggestions to try as in modifing the kits I have purchased. My guess is that from the attitude you display here that you came across the same way to them and no wonder you got what you did. Try being reasonable.

Another thing, just what did you expect for what they were charging for this kit. Sounds like you want top of the line for little or nothing.

>On the other hand, I am just finishing up the Ten Tec 2M kit; that's one
very
>nice kit, and I would recommend Ten Tec kits to anyone who wants to get
into

3168. Wanted: Simpson VU meter

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-30 00:00:00 UTC
From: jackg@xetron.com
Message-ID: <Ds8GzF.3EG@xetron.com>
Source record: 200448

Hi,

I am restoring a Gates Stereo Yard radio station console that I picked up recently. One of the VU meters has a bad movement, and I am looking for a replacement.

The meter is Simpson Wide-Vue Style meter model 1347. It is square, and measures 3.25" on a side, though the meter is called a 3.5 inch size. An A or B scale is fine, and a damaged case is ok also, as I have a good quality case and cover.

Please email if you happen to have one or know of a source.

Thanks,

Jack, WB8BFS

>Comet makes a dual band antenna called the SMA-3 that fits the FT-50R,
>and makes a considerable improvement over the stock antenna. HRO carries
>it in their stores. Gary WB7SLY

These two statments don't seam to go together. I bought the SMA-3 for
my Standard C508. It fits and works very well (but it is a bit long for a
small radio), So I know the SMA-3 fits on the Standard. If it also
fits on the FT-50R, then the connections must be the same.

I though that SMA was a standard like BNC, TNC, PL-259 or any other connector.

Many CB'ers have had their equipment confiscated on the basis that it was capable of transmitting in an unauthorized manner. In the past, those of us with Amateur Radio licenses seemed to enjoy an unwritten privelage in this regard. It's no wonder the F.C.C. is changing its position, especially given the continued abuses (like the frequent mods published in these newsgroups). Hams have now demonstrated their ignorance of the need for type acceptance in other services, and that they can no longer be trusted to comply.

The first statement is correct, but not because the feedline
is being tuned. As long as the line doesn't radiate or incur
excessive loss, the system overall can still be efficient. It
won't matter whether the antenna itself is resonant.

I bought the Yaesu SMA to BNC adaptor and a 1/2 wave Hot Rod for when I want to reach out. It's a bit fragile so I wouldn't leave it on and tightening the nut is a nuisance but it works.

Message-ID: <4okt6f$fr3@safety.ics.uci.edu>
Source record: 200459

I had the meter for about two days before I took it back for a refund.
I like the meter overall, but the one function I really wanted was
not working properly. I tried a second unit, and indeed the problem
seems to be a design flaw.

I wanted a good PEP reading wattmeter for SSB. The PEP function on
this meter is all but useless for SSB. It is an oversight, and I
am surprised it was not done properly. The PEP readings come very
quickly, so quickly that I cannot read PEP while speaking in a normal
voice. It seems to have no "peak and hold" circuit working with a
decent time interval so that I can read the meter. The numbers just
fly by, and I get nothing from it.

Now, the meter seems quite nice for CW and other modes. It seems
quite accurate down to low power levels. I like the way the physical
unit was designed, it is backlighted and easy to use. I would have
loved to keep the meter. But for SSB PEP readings, it is just
plain unacceptable. Even the average readings were pretty nonsensical
for SSB. Too bad. I went out and got the NYE Power monitor (for
the price of several Radio Shack meters :-) and I am OK now.

I have a GR300 UHF repeater. I have a Daiwa Power& SWR meter
hooked up to it ,and it reads 40 watts output and swr around 1.9

I took a Daiwa "N" connecter 2 position antenna splitter to hook
the antenna to one side and a 60 watt dummy load to the other side,
so I could switch the antenna feed line to the dummy load in case of
storms and for testing.
The problem I noticed is that on my meter, the watts out
dropped down to 30 watts either on the antenna or dummmy load.
Any one got a clue what is happing here? I checked the cables for
shorts and they OK
Appreciate all help,
Bill Rahl

> performance?
>

The IC-706 noise blanker works OK with ignition noise. Wipers, fans, and power line induced noises are not affected. On AM, the blanker is useful for moderate to weak signals. The blanker causes a popping distortion with strong signals. But the strong signals are usually stronger than the offending ignition noise in my car, so no problem.

I used to use an IC-735. Now there was a lazy man's noise blanker ... no need to bypass or filter anything, just push the button and adjust the blanking level ...

3189. Opinions on Ten-Tec 555 Scout

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-31 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <4on906$vd2@pulp.ucs.ualberta.ca>
Source record: 200314

Hi,
I'm sure this question has been asked numerous times, but a friend and I are interested in opinions and experience with the Ten-Tec 555 Scout. Camping and backpacking season is finally arriving here in Western Canada, and we are looking at inexpensive, portable rigs, with a reasonable current draw to take outdoors. We need something with more power than QRP, but don't need a ton of buzzers and bells. 80 and 40m coverage should be adequate for the time being. What is the construction like with the Scout, and what kind of current draw can be expected with lower power output (say 25W)? We are interested to hear any general user comments/experience with the rig.
Thanks,
Chris VE6RDC

I bought a new FT-736R back in Oct/Nov. of '95. I have never used a
FT-726R but I have been extremely pleased with the 736. I have been
told that the band modules are different between the two radios, but I
am not 100% sure.

In QST advertisements, the ICOM IC-T7A says it has "4W VHF OUTPUT -
With optional 9.6V BP-173" battery. Since they do say something like
"5 Watt output with 13.5V battery", they seem to imply that 9.6V is
the highest voltage battery you can use, and, consequently you will
need an adapter to use 12-13.8V from your auto. Can you advise me on
this?

For Sale: AR8000 Scanner and accessories.

I will only sell as a COMPLETE SET, I will not break them up! I have used the below Items VERY little, they are in ABSOLUTE MINT condition and all work perfectly. I have done the hot glue fix on the AR8000INF ribbon cable. I will also include a disk copy of the knowlege base I have accumulated over the last 1.5 years from Usenet groups and other places. It is about 115 KB in Word 6.0 format. I can TRY to convert it to other formats before shipping if necessary. If you meet or beat my price I will throw in a special bonus that I'd say is worth at least $50-$100 depending on if you are a collector.

Interested parties may contact me via email tom.howley@moa.net. If you live within resonable distance to Waterford Michigan, you can see it before you buy.

Paid New Item
$599.00 AR8000 Scanner- US Version

From: ad796@yfn.ysu.edu
Message-ID: <4onqd8$o4c@news.ysu.edu>
Source record: 200328

Hello,
I am on my local volunteer fire dept and I am considering
buying a new ht since my Icom 2AT is getting rather old. I am
really amazed by all of the features that are offered now and I
noticed that some of the radios have something called a CTCSS decoder.
At first I thought that because of this I would be able to use my new
HT instead of a pager that the fire dept hands out. These pagers can
be set so that they are quiet until an alert is sent out by the dispatcher.
They a set of audible tones is heard and the alert is spoken by
the dispatcher. Someone told me that this ruled out CTCSS tones since
they are sub audible. The tones that the fire dept uses are called
Quick Call 2 or also 2 tone sequential. I was wondering if anyone knew
of any ham hts that would be set off by these tones or that could be
modified to do such. Thank you for your help. If you could reply to
my email address I would deeply appreciate is since I will lose my
newsgroup reader when I go home for summer break. Thanks!

It is not a god :-)

It works well as a narrow filter for CW or for a notch filter
for SSB. For $39, it's a good tool if you are having problems
with heterodynes (squeals) on SSB, especially on 40m. It
automatically notches out the squeal. Its noise
cancelling does not work at all as far as I am concerned, except
maybe on CB AM.

3209. Kenwood interface IF-232C

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-31 00:00:00 UTC
From: shwol@worldonline.nl
Message-ID: <31af8091.15365445@news.worldonline.nl>
Source record: 200334

Hi,

Presently I am trying to connect my Kenwood TS450S to the serial port of the computer through the IF-232C interface.

The logging program, WJ2O, sees the serial port (com 1), however the data is not being transferred from the txvr to the computer.

The diagram of the RS-232C cable says that only pin number 1, 2, 3, 4, 5 and 7 are used. I tried those (pin 1 being the top-row most right pin of the 25pin socket of the interface when lookingTO the back of the interface).

My questions are:

1. Did I make the right assumption of the pin numbers of the 25-pin socket on the IF-232C interface?

2. Is there a way to check whether the problem is related to the interface, to the cable between the computer and the interface or to the software (the WJ20 logging program?)

Tks

<<
The Radio Shack HTX-202 comes with built in DTMF squelch. You send a DTMF
tone sequence and the other radio unsquelches and hears you. I think many
other 2 meter radios do this, but I don't know if it is built in.

CTCSS "subaudible" is a bit of a misnomer, you can hear it, but it is not
very loud... more like a light buzz. However, it does keep the radio
quiet unless that tone is recieved, then the radio unsquelches and can
hear your voice call. It is also called PL which stands for "private
line", a Motorola trademark. It was intended to let several users share
the same frequency (though not to transmit at the same time... it jsut
keeps the other people's radios off while you are talking to your cohorts)

WINDTRAX VII FLIGHT IS SATURDAY!!!

June 1, 1996 at approximately 1200 UTC (start checking about 6am Indiana time),

Launch site: 2.5miles east of Whiteland, Indiana (south of Indy about 10 miles)

Prelaunch Freqs: Check-ins: 3.871MHz, & 146.835/R locals
Nets begin at 1130UTC

Balloon Type: Kaymont 1200 Gr.

Parachute Size: 5 foot diameter custom made by KB9BSV

Flight packages;
Crossband repeater (by Paul /W9DUU)
2m rcvr to 6m & 70cm xmtrs, with voice ID & nicad pwr pack, dual half wave antennas
GPS/Packet(By Chuck/WB9IHS)
Garmin rcvr, Paccom controlled (HandiPacket) & down-linked on TEKK 446MHz xmtr.
Self contained, nicad & lithum powered, 1/4 wave xmtr antenna, Ball Corp stripline rcvr.
Stripline antenna on top of box. Audio beeper for ground retrival of packages.
ATV(by Terry/KT9V)
Two (2) B&W CCD cams, WB8ELK color video graphics downlinked on Wyman ATV xmtr
with 1/4 wave antenna. Self contained, lithum powered. CCD cams are mounted one
shooting horz., and one up, solid state switching controlled.

Flight Package Freqs;
Crossband rptr; Dn 52.525 & 444.85 MHz (VP) 50 & 100mW output Up @ 144.3MHz (VP)

GPS/PAcket: Dn 446.0 MHZ @1200 Baud packet (VP) 250mW output.

ATV: Dn 439.25 MHz (VP) 1.5 WATTS OUT!!!

All amateurs are welcome to participate, checkin, monitor feeds, etc. Pix will be posted on the following WEBSITE:

www.surf-ici.com/marc Stop by and get a birds eye view from 95,000 feet up!

For details on the WindTrax Group and the WindTrax program, contact Chuck Crist/WB9IHS via email, mai@iquest.net

In so cal there seem to be alot of 1.2 GHz band repeaters with 25 kHz channel spacing (i.e., 12xx.x25 MHz). The unit can be configured for 10 or 50 kHz tuning steps. (the IC-1200E can be set for 12.5 or 25 kHz steps), so I can't tune exactly (i'll be 5 kHz off those particular spots).

Is the diff between the 1200A and 1200E set by a jumper? Is there any way to accomodate this short of a lobotomy (of the radio, not me!)?

Bill,

For your info, I paid $190 at a flea market for a 3sat in excellent condition. I suspect you'll pay between that and $250.

Good luck.

Harold

3220. * Menace a nos bandes *

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-31 00:00:00 UTC
From: belsan@odyssee.net
Message-ID: <4omvus$9m5@pegasus.odyssee.net>
Source record: 200345
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.policy,rec.radio.amateur.space

visees sont celles qui sont les plus fortement congestionnees et utilisees. D'autres bandes qui auraient ete aussi bonnes au point de vue technique, et qui n'auraient pas nui a quiconque, ne sont pas comprises dans la liste. Il semble avoir un but politique ou personnel quelconque derriere ca, mais qu'importe la raison, ces propositions ne devront jamais devenir realite. C'est la premiere fois, de memoire, qu'un autre service serait propose pour la bande de 144 MHz. Faisons en sorte que ce soit la derniere.

Les deux bandes amateur visees consitituent les pierres angulaires de nos activites de service au public. Bien plus souvent qu'autrement, ce sont ces bandes qui servent le plus sur un site d'un sinistre ou d'une urgence quelconque, ou lors des activites de communications pour les evenement communautaires. La phonie, les donnees numeriques, mobile, fixe, meme la television, et la liste se prolonge, autant dans l'immediat que dans l'avenir. Quelle logique y a-t-il dans ces choix??

Meme apres que l'ARRL ait explique ces enjeux aupres des representants de l'industrie, on ne recut pas plus d'assurances que nos bandes seraient retirees. Meme qu'il fut repete que jusqu'a ce que leurs besoins soient satisfaits, toutes les bandes resteront sur la liste. Ceci n'est pas satisfaisant pour nous.

Alors, on vous appelle pour votre assistance pour defendre NOS bandes. Nous devons faire pression aupres des autorites americaines et canadiennes pour que ces propositions meurent dans l'oeuf. Nous devons faire valoir notre position avec une telle force, avec un tellement grand nombre de reponses que plus personne ne sera tente de recommencer une telle betise. Il ne faut pas attendre WRC-97 pour combattre cette menace, IL FAUT COMMENCER MAINTENANT.

Voici une liste d'adresses des gens impliques dans cette affaire, y compris celles des gens de l'industrie satellite (commercial) qui ont pris partie dans cette menace:

Cecily C. Holiday, International Bureau, FCC, Washington, DC 20554,
E-MAIL: choliday@fcc.gov FAX: 202-418-0748

Warren G. Richards, President, IWG-2A, Dept. of State, CIP 2529,
Washington, DC, 20520
E-MAIL: richardswg@ms6820wpoa.us-state.gov FAX: 202-647-7407

Tracey Weisler, Representant FCC, IWG-2A, International Bureau, FCC,
Washington, DC, 20554
E-MAIL: tweisler@fcc.gov FAX: 202-418-2824

Mary Kay Williams, Final Analysis Inc, 7500 Greenway Center, Suite 1240, Greenbelt, MD, 20770 FAX 301-474-3228

Il y aurait aussi Industrie Canada, qui pourrait etre interesse. Ou votre depute federal. Envoyez-leur vos commentaires,

en autant qu'ils sont polis. Si vous etes capables de faire vos arguments d'une facon intelligente et sans recourir aux insultes et aux menaces, c'est d'autant plus efficace pour attirer l'attention. L'objectif, c'est d'eduquer et de persuader, et non d'intimider, car les faits sont de notre cote.

Les preparatifs pour WRC-97 peuvent etre consultes sur le site WWW de la conference: http://www.fcc.gov/ib/wrc97/

Ecrivez maintenant. C'est important.

Isn't the President Lincoln the "export" version of the Uniden HR2510
10 meter Amateur transceiver?

You can get Uniden's parts department phone number on their web site
at:

www.uniden.com

If they can't help on the Lincoln service manual, an HR2510 is
probably fairly close if these radios are indeed different shades of
the same color.

3225. F.S. Universal M-400 Decoder with CI-400 Computer Interface

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-31 00:00:00 UTC
From: johnsw@mhv.net
Message-ID: <31ae590e.6140484@news.mhv.net>
Source record: 200378

I have a Universal M-400 Decoder (Version 2.0 - latest version)
complete with manual, power supply, computer interface, cables, and
Ci - 400 software. The unit is in excellent condition and will decode
the following:

Baudot
ASCII
SITOR A&B
FEC-A
SWED-ARQ
FAX
ACARS
POSAG Pager Data
Golay Pager Data
CTCSS PL
DCS PL
DTMF Tones

The CI-400 interface allows the unit to monitor user definable cap
codes which can be set to flag an alarm as well as store the dat on a
pc and/or print to printer. The unit is handy for monitoring your own
pages, news, weather,sports,emergencies, or anything else you may
want.

I am asking $350 for both or
$325.00 for the M-400 and
$50.00 for the interface and software.

: preferred as I cannot afford the new stuff.

Bob, I've got a 1995 Saturn SL-2 and (thankfully) only one year to go on the lease. I have NEVER owned a worse vehicle for RF noise, spark noise, etc. If your '94 is quiet (I get S9 static while the engine is running on 2M FM!) you are lucky. If not, try a rig with a good noise blanker - I use an FT-900at when I'm able to put up with the static.

If you have a friend with an HF rig you can borrow, connect it to the Saturn battery and tune around with an HF whip, maybe your will be clean.

It's not a bad car for the money but I would not sugest one to a ham.

This is a possibility. More likely, if the supply has seen heavy
usage, the plates in the transformer have become de-laminated and are
vibrating. For large transformers (without bolts) the fix is
understandably harder: Remove the transformer and squeeze the plates
together in a vise. Some transformers have bolts which can be
tightened but the less expensive ones have just a soft steel bezel
around three sides. This is the "tightening" adjustment point. I've
fixed many "buzzing" power suppies this way.

3230. Kenwood TM-733A memory mod?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-31 00:00:00 UTC
From: N3WUU <steves@clark.net>
Message-ID: <31AE7187.7FFE@clark.net>
Source record: 200383

I've been searching for a way to expand the 70 memories in the TM-733A. The rig does not accept the ME-1 option from Kenwood. I've checked all the available mod sites with no luck.

Anybody have a service manual that might give us a methodology for the mod? Reading the schematic implies that the display CPU is also the memory unit. If that's correct, the mod is probably not likely. Although, there may be a programming diode or resistor that could be clipped.

Any ideas would be welcome.
TIA

Let's see, I could buy that cable for .50 cents a ft OR.....

1.) larger non-metallic philystrand for the same price. It not only won't
rust, it won't affect my antennas.

2.) go down to the local CATV supplier and purchase 1/4 inch thick EHS
utility line grade heavy galvanized cable (that will last at least 20
years) for less than 10 cents a foot.

3.) buy stainless steel 3/16" cable for 12 cents a foot (that won't ever
rust and is thicker).

;-) Beauty is in the eye of the beholder.

> Even most hams would be unaffected as they are either
> dead, should be dead, or inactive.

So why do you use K1OIK to identify yourself? If hams are such losers,
it seems you would distance yourself from the group.

> Clearly almost anyone can better use ham frequencies than hams can.
> Have you listened to the important conversations plus contests
> and useless traffic on ham bands.

No, it's not MENSA discussions most of the time, but some people enjoy
these activities. Perhaps you could draft a list of approved activities
and
topics for discussion. I'm sure we could all sleep better at night
knowing
we are "K1OIK APPROVED".

I think if you don't like what you hear, change the frequency! All my
radios have
a knob or button to change it. If you can elevate the level of
discussion, join in!
I personally think there are more constructive uses for the space occupied
by
Major League ballparks, but some enjoy the experience, and the land on all
sides is used for other purposes, so it would seem everyone gets
something.

A lot of new blood has entered the hobby recently, with better operating
habits
than I hear used by some old-timers on HF. ncouragement to learn and
experiment and possibly
compete for at least equal footing with countries that take education
seriously,
we need more cable channels, satellite feeds, pagers, cell phones and
cordless
phones, and a populace that has NO IDEA how any of it works. What a bunch
of morons we have in the NASA astronauts who hold ham licenses. Just
think
how much better off life would be if we had done away with ham radio years
ago!
How useless all the hams were in World War II. Maybe Foot Locker will
start
a "Shoes for Amateur Radio Equipment" program. I can't wait!

And this computer! I'll just grab the phone cord and puBBBBBBBBBBBZZZZZ
ZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZZ

3244. Looking for CRT info for Heathkit 10 meg dual trace scope

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-31 00:00:00 UTC
From: Gary Steckly <gsteckly@clark.dgim.doc.ca>
Message-ID: <31AF1BBB.41F5@clark.dgim.doc.ca>
Source record: 200397

I recently acquired a Heathkit 10 meg oscilloscope - however the
CRT had been removed. I don't have a manual either, so I have no
idea what type of tube was in it.

Would anyone have a Heathkit model IO-4210 scope out there who
would be willing to give me that info? I would really like to get
a schematic for this thing too, and am willing to send a SASE with
a few bucks for the copying.

If you can help, please reply via email to gsteckly@clark.dgim.doc.ca

thanks

Gary

Working from memory, you have the base of a multi-channel military HF 2-18 MHz mobile antenna, hence the N connector. Your guesses about NOT disassembling the base and about requiring a long whip are correct, but I recall the whip length was 96". Maybe you can find an Army MARS member who could obtain the AT-1062/G performance specs for you.

>modifications, etc.

I would like to know more about this radio myself. A local ham bought one at the Gainesville Hamfest and he gives it a "buy" recommendation. All I know is that ADI stands for Azden Development Industries. As for modifications, I understand it is a simple keyboard sequence that opens up the extended receive and MARS/CAP transmit. I understand it uses Standard brand batteries, so third-party batteries are available. It has reasonably good intermod rejection and the output audio is good. The speaker is small so it is not good in a loud environment. The only problem I have with it (from the one occasion I saw it in person) is that the external power socket is on the back of the radio instead of the top where it belongs.

If you hear more about this radio, please give me a summary of the responses.

BTW, I understand that a dual-band version is being released this month, the AT-600.

>> . Looks like you use pin 3 on the acc bot 20 ma isnt going to get it you
>> must have to find a light relay to switch with les than that. Any help
>> would be great.
>
>May 1996 CQ, pp 30 -- EXACTLY what you wanted to know.
>
Here's more:

The CQ May 96 gives the following for a 737A that "will work with many current Icom
transceivers":

```
22 ohm 1/4W _
ICOM ACC(1) 0------\/\/\/\------(_)-- amp
OR ACC(2) DIN |
plug (both /------------------'
have pins 3 1/4 w /. (shield)
& 7 assigned 220 ohm 0 .
the same) 7 ---/\/\/\--------|---3
- 3
3 ---| 1N914 ^ 3 Radio Shack #275-283
|______________|___3 12V reed relay
```

If this is not understandable, read the article <g>. The text calls out
#275-233 and says it's 11 mA, so there is a discrepancy.

Why do you still have a ticket ???? You're either dead, should be dead or
Inactive ? Which is it ??? According to regulations.... Amateur traffic in non
emergency situations shall be restricted to items not interfering with
commericial telecommunications bussiness, ie it's supposed to be unimportant.
This philosophy allows foreign governments an opportunity to protect their
telecommunications industry. The intent of the FCC regs is to provide a pool
of technically trained people in communications and electronics for use in
emergencies. I believe the last "Emergency" was WW II. Communication is only
one facet of ham radio.

>up to us. Are we up to it? Zzzzzzzzzzz.

Voting won't stop it. For every thief voted out of office,
there are a thousand more, just as lazy, willing to say or do
anything to get elected. We won't be protected from this until
it's put in black and white in the Constitution. That's not
likely, considering the people who have to make the change are
the same opportunists who benefit from doing otherwise.

>PS- There is a FUNDAMENTAL PROBLEM with this. Politicians have NEVER
>heard the story about killing the goose that laid golden eggs.

Well, that's sort of like saying a thief has never heard of
incarceration. No, the fundamental problem is that a democracy,
in and of itself, is no more a guarantee of individual rights than
a dictator. Government confiscation doesn't become moral simply
because the majority decrees it. Constitutional protection is
required to differentiate democracy from mob rule.

These types of notices usually mean some forthcoming action from the FCC.
We'll see if they tell manufacturers to stop building amateur radios
capable of being opened up for all band TX.
This may finally be the start of new enforcement action to control illegal
operation of amateur equipment on Maritime and PLMRS frequencies where
type acceptance of equipment is mandatory. It is apparent that relying on
the amateur radio operator to stay inside the amateur bands has been a
failure.

PUBLIC NOTICE
FEDERAL COMMUNICATIONS COMMISSION
1919 M STREET NW
WASHINGTON, D.C. 2055462882

News media information 202/418-0500.
Recorded listing of releases and texts 202/418-2222.

May 13, 1996

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the Commission's Rules regarding equipment that is intended to operate in various radio services in the high frequency radio spectrum, including "10-Meter" Amateur Radio Service (ARS) equipment.

The Commission has noted that a number of transceivers imported as ARS equipment are also capable of transmitting and are being operated in nearby frequency bands allocated to other radio services such as the Private Land Mobile Radio Services, Maritime Services, Auxiliary Broadcast Services, International Broadcasting Services, the Citizens Band Radio Service, and the U.S. Government. Operation of this equipment causes interference to the authorized users of these frequencies. Some of these transceivers are capable of using output powers or emission types which are not permitted for the radio services listed above and some are capable of transmitting in the radio astronomy band where no two-way radiocommunication is permitted. Some manufacturers are promoting the sale of conversion kits, or have designed their transceivers such that they can easily be modified by the users, to extend the operating frequency range into the frequency bands listed above. In addition, so called "export" radios which are deliberately designed to facilitate this capability are also being imported and marketed.

Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use. The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required, because of the simplicity of modifying them to extend their operating frequency range. Transmitters designed and intended for use only in the ARS must comply with the applicable technical standards contained in Part 97 of the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to:
(1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio service(s) in which the transmitter is capable of operating;
(2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued; or,
(3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission-issued station license.
Violation of the Commission's regulations will subject manufacturers, importers, vendors and users of this equipment to appropriate criminal penalties as provided for by federal law(s), including fines and/or imprisonment. In addition, the equipment described above can be seized by, and forfeited to, the government.

For further information concerning this Public Notice, contact Gary Hendrickson at the FCC Laboratory, 7435-A Oakland Mills Road, Columbia,

Md. 21046, (301) 725-1585, Extension 223, or E-mail: ghendric@fcc.gov.

If you are a MARS or military station with legal authorization to transmit outside the ham bands, you can get the most accurate modification information directly from Yaesu. If you are planning to use a transverter to cover the entire 6M, 2M, or 70cm band, you'll rapidly find that SSB and weak signal activity resides in the bottom 500 kHz segments.

On the other hand, the FCC takes a VERY dim view of unstopped transmitters, as you can see in the public notice below which was recently issued. These types of notices usually mean some forthcoming action from the FCC, we'll see if they order manufacturers to stop building amateur radios capable of being opened up for all band TX. This may finally be the start of new enforcement action to control illegal operation of amateur equipment.

3255. Yaesu software??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-31 00:00:00 UTC
From: Clyde Soles <Clyde_Soles@nile.com>
Message-ID: <31AF171F.5421@nile.com>
Source record: 200408

OK, I have an FT-50R and would like to get the software for programming it. The crux is I have a PowerMac and it is a Windows program. Fortunately I should be able to run the program using SoftWindows 3.0 but I will need an adaptor for the cable. So has anyone out there done this? If so, do you know what adaptor is needed? Any help would be appreciated.

TIA

: Swithing between sidebands usb and lsb is not the proper way to set the
: master oscillator. You are probally thinking of the way to set the
: carrier points without test equipment. If you want to be accurate and
: apparently the original post is if they are concerned about 50 cycles.
: Forget WWV and set the freq. with an accurate frequency counter.

On the FT-1000, which controls (vari-caps) need to be adjusted
to set the carrier point? The service manual lacks a "Theory
of Operation" chapter so finding the specific part is quite
difficult.

3257. Re: Condenser Mic to Dynamic input?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-31 00:00:00 UTC
From: Roland Burgan <rburgan@up.net>
Message-ID: <4on374$18o@btc1.up.net>
Source record: 200410

It strikes me that using a condenser mike for amateur radio use
is a bit of audio fidelity overkill. It probrably will require
phantom power.

3258. Re: AMP HOOK UP FOR IC706

Newsgroup: rec.radio.amateur.equipment
Date: 1996-05-31 00:00:00 UTC
From: w8jitom@aol.com
Message-ID: <4on89t$84p@newsbf02.news.aol.com>
Source record: 200411

In a message dated 96-05-31 09:31:34 EDT, you write:

> Stuff...

The relay circuit in May CQ page 30 won't work with the 706.

The transistor buffer (figure 2) will work but it should really have a pull up resistor between the base and emitter of 47k to 1 meg ohm.

The text regarding the AL-80 is incorrect. The AL-80 manual clearly has a maximum sink current of less than 100 mA, and a open circuit voltage of around 15 Vdc maximum with pulse protection, so it will plug right into all ICOMS except the 706.

The authors suggestion to use the circuit in figure 2 with high voltage relay amplifiers like most Heathkits (and some other amps) is incorrect. The PNP switch he shows will not reduce the open circuit voltage between the amp and the radio keying line. The worst case scenario is a fried transceiver, not a fried transistor as he suggests.

Type acceptance would be a waste of everyone's time and money.
Besides, who cares what a CB'er does beow 28 MHz? The solution
is to prohibit sales of equipment capable of transmitting on the
Amateur bands to unlicensed individuals.

You may have to live with this. My older model Cubic does the same
thing, although it otherwise has excellent QSK. One of these days,
I'll investigate the time constants to see if there's a way to
soften the T/R clicks.

>
> What type of glue do you use to put it on with, and how well does it hold.

There is no actual "glue" used in these antennas... The mounting to glass is done with 2 sided tape, and holds quite well.. I have had 2 or three over the past 10 years, and have never had one fall off..

>If it holds too well, how do you get the antenna off?

It is fairly easy to get off when you need to...Usually a putty knife slid between the mount and glass is all that is needed to get one off..

What if it doesn't hold
>too good? Does it fly off as you driving down the highway? And does it leave
>any markings on the glass after you remove it?

Once it is removed and the glass is cleaned, you can't tell it was ever there. (assuming you are careful and don't scratch the glass taking it off..

>shorts and they OK

With a SWR of 1.9:1, the impedance at the feedpoint to the line
wil vary with line length, as will the accuracy of the meter.
Inserting the switch probably just changed the line length in
such a way as to cause the reading to decrease. Incidentally,
did the SWR measurement for the antenna change after you installed
the switch? Also, is the SWR 1:1 with the dummy load switched in?

3264. Problems with Alinco DJ-180T

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-01 00:00:00 UTC
From: hendric@ksu.ksu.edu
Message-ID: <4oonqv$geg@fox.ksu.ksu.edu>
Source record: 200218

Recently, my DJ-180T from Alinco lost its channel memory, and apparently a few other things as well. Once I recharged the battery, it will not allow me to go above 147.995MHz. I have tried resetting it and changing the channel step. Still nada. I know I somehow got it to work, because I used to have the National Weather Service stations (~160MHz) programmed into it. Any ideas would be appreciated. Thanks a lot!

I have been using Bob Heil's stuff since the early 80's. I have a PROSET
and like it very much. If you want good audio get the one with the HC5
element not the HC4. The audio from the HC4 is tinny and treble
soundingand helps when working DX but for overall fine sound get the
HC5.

Chris for what it is worth,
A) I do not own a Scout.
B) Can't afford one right now.

However, I have heard several good things and a few bad onthe Scout
performance. Bad have ranged from CW drift.. to the limited 1 band at a time
module. Good things have been said about the filter, power draw, and the
"Quality of sound" that the rig delivers.
I would love to purchase one....maybe a wedding present NOT!

Dont buy an MFJ tuner, period. They make some fine stuff, but their tuners are trash. I had a 3 KW tuner I bot at a hamfest....has a design defect. The inductor selector switch has chassis mounting bolts VERY close to some of the selector positions. If there is a voltage spike (and EVERY tuner will face this during tuning), the selector switch would arc to the mounting bolt and blow the switch. I bot several replacement switches before i gave up....

My MJF tuner (MFJ-941D) has been in service for over 10 years
with no problems. It has been used to tune numerous different types of
antennae from long-wires to full-wave loops and has done a credible
job.
I opted not get the tuner with a built-in dummy load, my
thinking being that I could use the dummy load at both my operating
position and on my workbench. A separate dummy load does make things
easier.
One note is that I annually clean the contacts, tighten the
hardware and do a general physical inspection. I just consider this
routine maintenance.

3284. Advice needed on mobil installation in Saturn

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-01 00:00:00 UTC
From: jcall@sirius.com
Message-ID: <4oq9ca$sve@sun.sirius.com>
Source record: 200238

Has anyone here had experience in putting a 2m mobile rig
into a 1996 or earlier Saturn ? Iwould like to install my
Yaesu FT 2400 mobile which can put out 50 watts and am
concerned about setting off the airbags or doing damage to
the onboard computer electronics on board from stray RF. I
could either use a trunk lid or roof mount antenna. I've talked
to Saturn service people but they have no suggestions or warnings.
I suspect that the ones I've talked to don't have much experience
in this area.
Thanks

Jim Carrington KD6JTY

No....well not yet anyway. You can do the diode mod and open up the tx from 0-200MHz but the section from >60 to 144 it only puts out <1mW qqqqqqQRP!!

I understand that ICOM UK are working on a mod to bring up the 4m side for Tx and this is to be publsihed in HRT soon ?

3290. Help for Guyana

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-01 00:00:00 UTC
From: ptay@interlog.com
Message-ID: <4oqa4i$b4c@news.interlog.com>
Source record: 200244

I recently returned from a trip to Guyana. People living in the savannahs there generally have no access to communications. Some people there are interested in getting used 144 MHz public service transceivers and setting up a repeater(s) on a mountain. Can anyone help me find equipment sources and info on this subject? The country is very poor, so cellular links and new ham equipment are not an option. Also, I would appreciate finding appropriate sources for technical info and educational material, as the 'information vacuum' in Guyana is almost as great as the lack of capital. Thanks in advance for any help you can give.

From: kerbugh@aol.com
Message-ID: <4oqcll$b4s@newsbf02.news.aol.com>
Source record: 200245

I have the Argo 556, almost the same as the Scout but without the 50 watt final. While I would hardly consider the Scout "inexpensive", if you are planning on using several frequencies I believe it will, in the long run, balance out over the single band (kits). Quality appears very good, not sure if I would throw it into my backpack and take it out into the woods, but it certainly *feels* sturdy enough. According to the Operator's manual:
10A transmit @ 50 watts out
4.5A transmit @ 5 watts out
let me know if you need any more of the technical details, as long as their "in the book" :-) I did have some trouble initally with the power output. A call to Ten-Tec customer service quickly resolved the problem and I recommend the company (or at least their support) highly. You must be careful to FULLY insert the frequency module into the unit (flush with the face). I did not have the module in all the way and it gave some funny power output readings. Once the module was pushed all the way in it worked fine. I hope to use my Argo eventually with solar power, but that is still a little in the future. As I said, the Argo is thebut I must admit I have not had occasion to travel with it yet. Let me know if I can help with anyother info.

You can. Here's how to do it, courtesy of Gary, Icom America

1. Set up the frequencies you desire to use.
2. Lock the keyboard by pressing Function and C, then turn off the radio.
3. Press and hold the MONI, RPT, and # while turning on the radio.
4. You will now see a flashing ' L ' in the lower right side of the
display. The radio will now be in cross band repeat.
5. To revert to normal operation repeat step 3.

Tried it & it worked fine.

I don't have one myself, but one of my friends installed one around his property. He has had no problems with intermod on the collars, but he lives pretty far out of the city, too. I can't imagine they are overly selective receivers, and I'm sure given the right strength/frequency combination, they would be suscpetible to false triggering.

As to the effectiveness, my friend has 5 dogs on his property, 4 won't even wander near the fence any longer (his property is fenced and the wire is buried about a foot inside his fence-line) and the fifth dog shakes it's head but continues on and digs out under the chainlink fence while being "zapped."

Guess in his case that's 80% effective. Are you in an area that prohibits an electrified wire around your property? I put up a "Fido-shock" brand electric fence, no chance of false triggering and my dog hasn't left the back yard since. Took him two "zaps" to get the idea. After about 2 weeks, I unplugged the power supply and haven't plugged it in again. I have a five year old boy, and he doesn't mess with "the wire" because we told him it was electric. Even if he did, it's not plugged in anymore. Good luck with whatever you choose.

Hi Ben,
I use a Larsen dual band duck and have been real happy with it. For the heck of it, latch onto a VHF/UHF SWR meter and put inline with your duck. You wonder how they work at all! The Larson actually gave me a reading below 2.0 to 1. The HT (TH77) ran much cooler with the Larson vs the Kenwood original.

Jim,
It's one of the nicest treats to do for your rig, and yourself. I love mine. High Quality good stuff! I have a voice about 3 octaves below gravel gerty (maybe before your time) and I use the DX HC-4 element. I get quite a few excellent audio reports off of both the TS-450SAT and the TS-850SAT. The DX element has a lot of drive so you can speak in a very normal voice with terrific results. Do it!

3319. Mics with new rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-02 00:00:00 UTC
From: res@cmprime.cis.att.com
Message-ID: <4oqs6s$l78@anchor.cis.att.com>
Source record: 200257

I bought a new IC 736 HF rig in Dayton 2 wks ago and found when I got home that there was no hand mic packed with it. In all other respects it is perfect. The owners manual says there is one packed with it and Icom brochures (although printed a few years ago) say a mic is included.

I contacted the dealer today and he told me Icom doesn't include them any more with high end rigs - that they expect users will buy desk mics anyway. Makes sense to me, but I still felt cheated. He gave me a new mic in a box, no charge.

Has anyone else experienced this same thing? Of course I expect to check with Icom next week to verify but I wonder what the net thinks.

We should be dead ? Is that the idea of this all ? Hey, I got a great idea, why don't we do whatever we want on the airwaves, because as soon as someone says money, they can do whatever they want to, right ? Rumor has it that one of the biggest supporters of LEO is Bill Gates of MS, although I really don't know why he'd be interested. Every day I'm seeing more and more that supports the total " assholiness " of the plastic generation. I suppose if they had it their way, we'd all just be able to bend over and kiss their asses on request. Because hey, they're some really good guys, and one look at us will tell you how bad we suck.

Have they ever done anything on their own, original, or is this another attempt at crass commercialization of someone else's good idea? We're just curious, because we don't really have anything to lose anymore. See, they came and ripped us off before they put the bid in, and I'd worry about that statement, if there wasn't ample proof. Seems maybe they are interested in us, after all. God help the clueless.

>73, Jim

Hi Jim,

I could write all night on the pros and cons of the Heil products. I contest, and do fairly well. I was #6 in N. America in last years Nov SS phone (Low power). Heil makes a very good mic element. I think they should have stuck to that. The president of Heil has a background in broadcast audio, and he has made a fine product. However, in an attempt to make lots more money, he branched out into the "headphone" arena to fill a needed void. Face it, there aren't may companies offering good quality boomsets for serious ham radio operating. The headset arena is where Heil falls way short of the mark. (Don't get me wrong, I own two and have owned three). Lots and lots of people have plugged the BM-10 and the new proset into thier high end ham gear and have noticed that the headphone audio doesn't quite sound right. It kinda sounds like someone has shoved cotton balls into the speaker elements. Heil says the problem is with your radio. Mr. Heil thinks we are all idiots and don't know how to run an audio gain control. In one of his newsletters he writes that if hams aren't getting enough audio into the headset, they should plug the headphone into the external speaker jack on the back of the radio. I was so pissed at this that I launched a personal investigation and found out what the problem really is. Impedence. It's quite simple. Your headphone output on the radio is around 8 ohms, the Heil headset (and this varies between models) is nowhere close to 8 ohms. That is why the audio is shitty. The hams that don't notice this aren't professional operators or have never had the joy of listening to a high end 8-ohm headphone (Kenwood, Icom, etc) plugged into their rigs. Mr. Heil doesn't care about the impedence mismatch, he just wants to sell headphones and he will give you all this bullshit about the "test radios" he has that have worked just fine with his product. The truth of the matter is that his headphones suck, and his mic elements are the finest there is. My Proset was so bad on my FT-1000D that I got rid of it. I got the proset micro. It has the same mic element of course (nice, wonderful, crystal clear) and the audio coming out of the headphones is "alright." A dramatic improvment over the standard

Proset, but not as good as Kenwood or Icom ham radio headphones. A source close to the company has told me that the imp. of the proset micro is closer to the mark.

Heil has made improvements in the overall product since the BM-10. The BM-10 with its three long strands of kinky wire was a nightmare. I'm surprised that more operators haven't accidently hung themselves while operating.

In short, this company has a long way to go before they come up with a product that they can be proud of, except for thier mic elements.

3325. FT-51 Modification for 800 MHZ as well

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-02 00:00:00 UTC
From: ronen@netmanage.co.IL
Message-ID: <Chameleon.4.00.6.960602120205.ronen@ronen.netmanage.co.il>
Source record: 200263

Hello All

Following is a Instructions for the FT-51R Modif for Out of Band As well as 800 MHZ

1) Jumpers 1 and 3-7 have to be opened and Jumper No 2 have to be closed
(for eropean models jumper No 4 have to be closed as well)(closed = Jumpered)

2) Turn on the radio While you simultanuesly pressing the up two volume Buttones
(Volume Up and Volume Down) and the call button.

3) Press F (function for more then One Second)

4) adjust the Display With the up or Down arrows) to see Band 7 , When done
Press F and afterword Call buttones.

5) Turn Off the Radio

6) Turn it on While you press simultanuesly the up and down Arrows

7) Repeate steps 2 to 6 twice per every VCO (Every Band).

After the Modifications are done , the Radio will receive (show in the Display)
50-999 MHZ for VHF
60-999 MHZ for UHF
and (supprise) 800-999 As well...
Note , The radio I have done it Did NOT receive anything on the 800MHZ , which lead
to a suspect that the radio have NO RF Unit for 800 MHZ , But another radio ,
(the one I got the modification from) Receive very well the 800 MHZ

Good Luck

>Regards ... Barry

Ok Barry

I am also very pleased with the rig. I found it slightly complex at
first and took a while to get used to finding the best rx settings but I
came down to earth with a complete thud, when I was in Ireland last
weekend and set up a station with my ts50. I couldn't believe that the
noise in the headphones on 40 & 80 m was so bad. The FT1000mp really
does make listening a lot easier. I have had no problems except for
trying to to choose how the tx audio should sound, with up to 30 odd
combinations i'm spoiled really. I have finaly chosen to leave the tx
dsp off, and use an electrecet insert in a stereo headset/boom thing
that I got from maplins. The rf speech processor was strange to me at
first, but it I can see the better side of it now as its a lot easier to
adjust the the audio types i have had on previous rigs. The rx dsp is
always on, and the auto notch is on 95% of the time. It a lovely radio,
I am very very pleased with it.

Cheers

I purchased the '3 KW' Differential T-Tuner. Took me
about two days before the roller inductor melted into
a pile of goo.

But MFJ's service is as good as thier product - after a long
international telephone call I convinced them to send me a
new roller inductor instead of sending back the tuner and they
did - in a nice white box with 'REJECT' written in red on the
outside of the box. The 'new' roller was so warped it wouldn't
roll.

In my opinion, they live up to thier name - Mighty Fine Junk.

>licensed for this purpose (FM broadcast band, aircraft band, etc.)
>while also transmitting on the intended frequency. The filter
>should have been included as part of a decent (or just legal) design.

I have to agree with this. The description of the kit should
mention the need to add external filtering. What they're selling
is a kit to build a comb generator, not a transmitter.

Also, price is irrelevant unless one assumes that cheap pricing
entitles a manufacturer to use deceptive practices to sell their
product.

*****ARRL NEW ENGLAND DIVISION SPECIAL BULLETIN 96-9A*****

QST to all Amateurs

May, 1996

Strafford, VT

NEW ENGLAND DIVISION DIRECTOR NEW ENGLAND DIVISION VICE DIRECTOR
Bill Burden WB1BRE Warren Rothberg WB1HBB
wb1bre@arrl.org wb1hbb@arrl.org

********** 2 Meter AND 70 cm BANDS THREATENED **********

THIS IS NO JOKE!! ARRL HAS LEARNED THAT IN PREPARATION FOR THE
WORLD RADIO CONFERENCE IN 1997, REPRESENTATIVES OF THE LOW-EARTH-ORBIT
(LEO) INDUSTRY PROPOSED A LIST OF CANDIDATE FREQUENCY BANDS FOR
REALLOCATION TO, AND EXCLUSIVE USE OF THE MOBILE SATELLITE SERVICE. THIS
LIST INCLUDES 144- 148 MHZ (THE CURRENT AMATEUR 2 M BAND) AND 420-450 MHZ (THE
CURRENT AMATEUR 70 CM BAND)!
IF THIS EFFORT WERE TO BE SUCCESSFUL, IT WOULD MEAN THE END OF
AMATEUR OPERATIONS ON THESE TWO MOST HEAVILY UTILIZED AMATEUR VHF/UHF
BANDS!

I have included the text of Dave Sumner's upcoming editorial for
July QST in this bulletin. ARRL, as the principal representative of
Amateur Radio in Washington, is actively pursuing this issue as this
bulletin is being written. Dave's call to action is serious!! We could lose these bands if
we do not take action now!!
Club presidents and newsletter editors: please make this
information available to your membership as soon as possible.

Follows the text of Dave Sumner's July QST editorial:

WRITE NOW!!!!

Get out a pen and paper, or boot up your computer. There's work to
be done! Your help is needed to defend two meters and 70 cm. Yes,
that's right -- the two most popular and crowded amateur VHF/UHF bands!
But don't panic, and don't "go ballistic."
Here's what's happening, and what you can do about it.
The United States is preparing for the 1997 ITU World
Radiocommunication Conference, WRC-97. In the past, the public has been
able to participate in the preparations for such conferences by
responding to FCC Notices of Inquiry. In March, the FCC announced a
streamlining of its International Bureau's preparatory processes for WRCs.
Under the new scheme, the NOIs have been eliminated in favor of increased
emphasis on WRC Advisory Committees.
For WRC-97, a series of Informal Working Groups (IWGs) of the
Advisory Committee has been created to address specific agenda items.
The output of each IWG will go directly to a joint FCC-NTIA-Department of
State Steering Committee of the Advisory Committee. There, draft
proposals as received from the IWGs will be reviewed and forwarded to the
FCC for possible release as preliminary U.S. proposals for public
comment.
In announcing the streamlined WRC preparatory process, the FCC tried
to reassure those who might be concerned about reduced opportunities for
public participation: "Interested parties should note that input to the
Advisory Committee may be sent at any time directly to the Chair of the
WRC-97 Advisory Committee; the Chairs of the Advisory Committee's
Informal Working Groups; Cecily C. Holiday, the FCC's federal officer
of the WRC-97 Advisory Committee,on C. Ladson, the alternate
federal officer."
Hold that thought while we shift gears to the substance of the
issue.
One of the WRC-97 agenda items includes consideration of possible
additional frequency allocations for the mobile- satellite service.
So-called "little LEOs," low-earth orbit satellites below 1 GHz, already
have allocations. Their proponents claim these are inadequate and are
trying for more. The needs of little LEOs are being addressed in IWG-
2A, chaired by Warren Richards of the Department of State. The ARRL
technical relations staff participates in IWG-2A to represent Amateur
Radio interests.
At the May 7 IWG-2A meeting, an industry representative proposed a
list of "candidate bands" for little LEOs. The list includes a number of
bands that would negatively impact existing services, and does not
include others that would be technically
more feasible but to which strong objection from incumbents could be
expected -- the point being
that some political, rather than purely technical, judgment already has
influenced the list.
Incredibly, 144-148 and 420-450 MHz were included on the list! This
is the first time in memory that another service has been proposed for

the two-meter amateur band. We must make sure it is also the last time. We do not need to explain to ARRL members the extensive use that is made of these bands by amateurs. The two bands provide the backbone of our local public service communications effort. Voice and data, mobile and fixed, even television -- the list of present amateur uses is a long one, and of future uses is even longer. Both are already used for satellite services and for moonbounce and extended-range terrestrial operations requiring extremely sensitive receivers and high levels of effective radiated power.

Apparently we did need to explain all this to the little LEO industry representatives, so we did just that -- both at the meeting and iup letter on May 15. We also explained that we had to regard the matter as extremely serious. No one with the slightest background in radiocommunication could possibly believe that a mobile- satellite service could be introduced into either band without disrupting existing and future amateur operations. Therefore, we said, if we did not receive assurance that they would be taken off the list of candidate bands by the deadline for this issue of QST, we would have no choice but to bring the matter to the attention of the entire membership.

The response we received was unsatisfactory. In effect, we were told the little LEO industry would consider our views but that until their spectrum needs are satisfied, all bands must remain under consideration.

So, this is a call to action. We must get across to the industry and government participants in IWG-2A that the 144- 148 MHz and 420-450 MHz bands cannot be considered as candidates for mobile-satellite services. We need to drive the point home so forcefully, with so many grassroots responses, that no one is ever tempted to try this again.

Which brings us back to that invitation for "interested parties" to send input "at any time." There's no time like the present! Here are the key addresses, including those of the mobile-satellite industry folks who seem to have started the ruckus:

Cecily C. Holiday, International Bureau, FCC, Washington, DC 20554; choliday@fcc.gov; FAX (202) 418-0748.

Warren G. Richards, Chair, IWG-2A, Department of State, CIP 2529, Washington, DC 20520; richardswg@ms6820wpoa.us-state.gov; FAX (202) 647-7407.

Tracey Weisler, FCC Rep., IWG-2A, International Bureau, FCC, Washington, DC 20554; tweisler@fcc.gov; FAX (202) 418-2824.

Mary Kay Williams, Final Analysis, Inc., 7500 Greenway Center, Ste. 1240, Greenbelt, MD 20770; FAX (301) 474-3228.

Leslie Taylor, LTA, 6800 Carlynn Court, Bethesda, MD 20817; ltaylor@lta.com; FAX (301) 229-3148.

Do comment. But be civil. Don't abuse people who are simply doing their jobs. We have to get across that casting covetous eyes on amateur bands is counterproductive, and contrary to the public interest. To accomplish this we need a lot of comments, including yours. But remember that the objective is to educate and persuade, not to intimidate. We don't need to. The facts are on our side.

To monitor the FCC's ongoing WRC-97 preparations, visit its WRC-97
home page at: http://www.fcc.gov/ib/wrc97/.

Hello All:

Picked up a Radio Shack digital signal processor on
sale $34. Has anyone found a way to modify this dsp so that
in the CW mode the passband is shifted up in freq to be
usuable with fsk (rtty, pactor, etc.) modes.

Shack does not supply a schematic with the unit.

I don't know much about ABS, but I do seem to remember something
about fuel injection that has to do with the way some systems
meter intake airflow. If I'm not mistaken, they use a heated
wire at the input to the metering unit, and airflow is determined
by measuring the current change through the wire. As more air
flows, the wire becomes cooler and more current flows. This is
computed in conjunction with ambient air temperature and other
factors in order to arrive at instantaneous calculations of
airflow. Also, if I'm correct about the system, this particular
function is cut off during idle, at which time radiation from the
metering unit decreases. It's possible this might also be linked
to the clutch, as airflow metering is not so critical at no load,
even when the airflow valve is opened to accelerate the engine.

Perhaps someone more knowledgable with current designs will know
whether this system is still in use, and whether I'm correct
about the way it works.

The following really is the view of the typical ham wife.
The reason they are that way has to do with the way the ham is.

The following is a reprint from The Madison Institute Newsletter,
Fall Issue, 1894:
====
INSTRUCTION AND ADVICE FOR THE YOUNG BRIDE
On the Conduct and Procedure of the
Intimate and Personal Relationships
of the Marriage State for the
Greater Spiritual Sanctity of this
Blessed Sacrament and the Glory of God
by
Ruth Smythers beloved wife of
The Reverend L.D. Smythers
Pastor of the Arcadian Methodist
Church of the Eastern Regional Conference
Published in the year of our Lord 1894
Spiritual Guidance Press
New York City

To the sensitive young woman who has had the benefits of proper upbringing, the wedding day is, ironically, both the happiest and most terrifying day of her life. On the positive side, there is the wedding itself, in which the bride is the central attraction in a beautiful and inspiring ceremony, symbolizing her triumph in securing a male to provide for all her needs for the rest of her life. On the negative side, there is the wedding night, during which the bride must pay the piper, so to speak, by facing for the first time the terrible experience of sex.

At this point, dear reader, let me concede one shocking truth. Some young women actually anticipate the wedding night ordeal with curiosity and pleasure! Beware such an attitude! A selfish and sensual husband can easily take advantage of such a bride. One cardinal rule of marriage should never be forgotten: GIVE LITTLE, GIVE SELDOM, AND ABOVE ALL, GIVE GRUDGINGLY. Otherwise what could have been a proper marriage could become an orgy of sexual lust.

On the other hand, the bride's terror need not be extreme. While sex it at best revolting and at worse rather painful, it has to be endured, and has been by women since the beginning of time, and is compensated for by the monogamous home and by the children produced through it.

It is useless, in most cases, for the bride to prevail upon the groom to forego the sexual initiation. While the ideal husband would be one who would approach his bride only at her request and only for the purpose of begetting offspring, such nobility and unselfishness cannot be expected from the average man.

Most men, if not denied, would demand sex almost every day. The wise bride will permit a maximum of two brief sexual experiences weekly during the first months of marriage. As time goes by she should make every effort to reduce this frequency. Feigned illness, sleepiness, and headaches are among the wife's best friends in this matter. Arguments, nagging, scolding, and bickering also prove very effective, if used in the late evening about an hour before the husband would normally commence his seduction.

Clever wives are ever on the alert for new and better methods of denying and discouraging the amorous overtures of the husband. A good wife should expect to have reduced sexual contacts to once a week by the end of the first year of marriage and to once a month by the end of the fifth year of marriage.

By their tenth anniversary many wives have managed to complete their child bearing and have achieved the ultimate goal of terminating all sexual contacts with the husband. By this time she can depend upon his love for the children and social pressures to hold the husband in the home.

Just as she should be ever alert to keep the quantity of sex as low as possible, the wise bride will pay equal attention to limiting the kind and degree of sexual contacts. Most men are by nature rather perverted, and if given half a chance, would engage in quite a variety of the most revolting practices. These practices include among others performing the normal act in abnormal positions; mouthing the female body; and offering their own vile bodies to be mouthed in turn.

Nudity, talking about sex, reading stories about sex, viewing photographs and drawings depicting or suggesting sex are the obnoxious habits the male is likely to acquire if permitted. A wise bride will make it the goal never to allow her husband to see her unclothed body, and never allow him to display his unclothed body to her. Sex, when it cannot be prevented, should be practiced only in total darkness. Many women have found it useful to have thick cotton nightgowns for themselves and pajamas for their husbands. These should be donned in separate rooms. They need not be removed during the sex act. Thus, a minimum of flesh is exposed.

Once the bride has donned her gown and turned off all the lights, she should lie quietly upon the bed and await her groom. When he comes groping into the room she should make no sound to guide him in her direction, lest he take this as a sign of encouragement. She should let him grope in the dark. There is always the hope that he will stumble and incur some slight injury which she can use as an excuse to deny him sexual access.

When he finds her, the wife should lie as still as possible. Bodily motion on her part could be interpreted as sexual excitement by the optimistic husband.

If he attempts to kiss her on the lips she should turn her head slightly so that the kiss falls harmlessly on her cheek instead. If he attempts to kiss her hand, she should make a fist. If he lifts her gown and attempts to kiss her anyplace else she should quickly pull the gown back in place, spring from the bed, and announce that nature calls her to the toilet. This will generally dampen his desire to kiss in the forbidden territory.

If the husband attempts to seduce her with lascivious talk, the wise wife will suddenly remember some trivial non-sexual question to ask him. Once he answers she should keep the conversation going, no matter how frivolous it may seem at the time.

Eventually, the husband will learn that if he insists on having sexual contact, he must get on with it without amorous embellishment. The wise wife will allow him to pull the gown up no farther than the waist, and only permit him to open the front of his pajamas to thus make connection.

She will be absolutely silent or babble about her housework while his huffing and puffing away. Above all, she will lie perfectly still and never under any circumstances grunt or groan while the act is in progress. As soon as the husband has completed the act, the wise wife will start nagging him about various minor tasks she wishes him to perform on the morrow. Many men obtain a major portion of their sexual satisfaction from the peaceful exhaustion immediately after the act is over. Thus the wife must insure that there is no peace in this period for him to enjoy. Otherwise, he might be encouraged to soon try for more.

One heartening factor for which the wife can be grateful is the fact that the husband's home, school, church, and social environment have been working together all through his life to instill in him a deep sense of guilt in regards to his sexual feelings, so that he comes to the marriage couch apologetically and filled with shame, already half cowed and subdued. The wise wife seizes upon this advantage and relentlessly pursues her goal first to limit, later to annihilate completely her husband's desire for sexual expression.

Source record: 200283

I could really use a schematic/service info for an old Kenwood
TR-8400 that I recently acquired. This 440 Mhz FM radio works fine
on the repeaters, but I want to use it on packet. The local packet
frequency is 441.000, that's when I discovered the problem: it won't
transmit in simplex mode between 440.000 and 445.000 on any even
multiple of 25 kHz. In other words, it works fine on 441.025 and
441.075, but not 441.000 and 441.050..... really weird. Obviously,
a PLL/synthesizer problem, but darn near impossible to trouble shoot
without at least a schematic. Can anyone help?

Thanks.

I bought a box of junk that used to be a "Lafayette Comstat 25A" 23 channels citizens band radio. There isnt much left, and all the tubes are gone from inside it (it's got an inspection date of early 1969 on it), plus (i assume) it was before circuit cabinets/pcb's so its all wire to wire so God knows what else is wrong with it. Just wanted to let anyone who might be rebuilding one / looking for one know that I have it and they're happy to any pieces of it before I rip it apart.

Oh yeah, I can also send you the tube sockets (7 and 9 hole) if you need them for another project. Advance apologies as I couldnt read the charters for the groups I posted to (thats quite a few) since I'm not even a Ham. I tried stripping it down as much as possible, replies to email unless relevant to group (in which case, gimme a Cc because I might be interested).

TIA,
-llama

For the same $$$, get a VCI300DLP (also sold under Tucker name) ...
MUCH better contruction, VERY much better appearance, and solid
performance. MFJ varies greatly due to (IMO) poor quality control.
I've determined never to own another piece of MFJ gear!

Hi Tony,
When I spoke w/ Icom last year, they told me there was no service manual for the 245SSB- I have never heard of the models a,E etc- what are these? Someone else here on the Newsgroup also recently called Icom and got same answer. They did send me the owners manual and I have mine up and running w/ those schematics.

I live in an apartment and I cannot place a good antenna to
use my Kenwood TS-50s + Antenna Tunner (AT-50).
I tried a vertical R7, and a dipole, but the conditions are no good
for a permanent setup.

I'm asking $950 for both units, I'll include original Manual + Boxes.

Equipment is in perferct shape
(I also need the money because a new baby is on its way!)

let me know...
thanks

andres

If you want my feedback they, in my humble opinion (tunners) are an
absolute piece of shit. I really like that 300 watt balun, take a
look at it and tell me if you would want to run more than 50 watts
to it. Some people I know had good luck with their tuners, but
the balun is underrated, and the circuitry is in no way a 300 watt
tuner, QRP yes 100 watts, maybe depending on antenna, any more or
using anything but a antenna close to resonance and using the
tuner to broden it as in cutting a antenna cut for 3750 and tuning
the entire band which it will do, I would think twice and as a
matter of fact had one of them blow up the output cap in a collins
100 watt transmitter, Quite a reality check. If you intend multiband use
with tuned feeders go find a johnson matchbox it will beat the pants off
of about anything else you will find, the matchbox dont cover 160
without modificationbut with a 135 foot flattop and 450 ohm feeders
after you get use to the way they work
you will have a good setup, no rap really against the mfj they just arent
what most people think they are and they get into trouble trying to
match systems at power levels they cant handle.

Thought you captured the relative merits of the T7A versus the FT50R quite well. I also own both, and am hanging on to both, but I do much prefer the smaller size of the T7A. It fits into my pants pocket very well indeed. I only wish it had 800MHZ coverage. Great little radio. 73

Here it is again:

Here is the extended TX mod that was on the internet. Please proceed at
your own risk!!! This mod opens up TX in VHF 140-174 MHz and UHF
420-469 MHz

1. Take the battery off.
2. Peel the NiCd warning sticker off of the radio.
3. Remove the two screws that were under the sticker.
4. Gently pry off the keypad paying attention to the gasket.
5. You will be looking at 3 jumper pads.
6. The 1st pad on the left will have a blob of solder on it.
7. Carefully remove the solder blob.
8. Reassemble the radio paying close attention to the gasket insertion.
9. Hit the reset keys as mentioned in the manual.
10. Extended TX mod is complete.

I'm currently working on a driver for JVfax ver 7.1 to
work with the MFJ1278B in 16level mode for SSTV. I have the
receive part working but its very buggy at the moment.

It would be nice if I can get some support, but it seems that most
hams talk about sstv on 14.230/14.233 and send very few pictures.

I have asked in the past if there was a driver available, and the
only answer was to modify the TNC for DTR/CTR/DSR/CTS operation.
I'm not one to start pulling wires and makeing drastic changes to
my equipment if I don't have to.

If there is anyone out there with the same problem let me know
I will make the driver available when it is done.

From: ddeeds@aol.com
Message-ID: <4p08cu$c7p@newsbf02.news.aol.com>
Source record: 200015

There really isn't any way to change the power ranges. I personally just use it in auto-range mode.

The peak hold time is done with software and there also isn't really any way to change this. The timing was redone several times during development at Radio Shack's request and what you see is what you get. Unfortunately complaining to RS won't get you anywhere as far as future changes, since Tandy pretty much shut down our department. Since I was the one who wrote the software and I don't work there any more, I wouldn't count on any future upgrades.

From what I know, this is not an antenna tuner. It is merely an SWR
meter, for what frequency ranges I don't remember.

Hello everybody...

Some months ago I had a FTP site where I could find a lots of mods for
radios. A terrible virus named "BARROTES" came on my O.S and clear all my
partitions with deleting all...

I need to know where is this site on internet. I need to make a mod on my
TM733 ...

Many thanks ! 73s

3380. FT757GX Info & help Request

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-03 00:00:00 UTC
From: billh@getnet.com
Message-ID: <4ovt2i$bk9@news.getnet.com>
Source record: 200023

I have discovered(owning a FT757GX) there is a difference between the GX and the GX II that is very important to those of us wanting to control the radio with a computer. In a GX there is only data flow in - no acknowledge or status out. The GX II (among other changes) has data coming back out.

I have found several programs written for the GX II which will NOT work on a GX. Has anyone seen a program for the GX??? Or has anyone seen a mod for the GX to get serial data out? Any help would be appreciated.

The best thing to do with the 2m Ringo Ranger is to throw it in the trash and put up a homemade 1/4 wave groundplane. You will get the same results from the 1/4 wave. Or better yet sell the Ringo to someone who don't know how bad they are.

Good luck

>the same type & gender, (sma) that is on the FT-50r?? If so, the Standard
>antenna is much smaller and would work nice on the FT-50r

The antenna is the same (sma) type as the ft-50. I had one of the
508A's and the small antenna works great in the ham bands but for
the wide receive built into the yaesu it would perform poorly. One
other comment...I wouldn't go pumping 5 watts of rf into an antenna
that was designed for 300mw!

BTW: If your still interested in the 508A antenna it can be order from
Standard for $25.00 plus shipping!

It is a good notch filter. If your receiver already has a good CW filter
the RS filter won't help a lick. The noise reduction isn't one at all. It
was a conceptual mistake.

>N5LB

Lionel,

I have been using the P38 for nearly six months and love it.

It takes some getting used to. It requires a pretty accurate tuning of the rig, but the P38 has a couple of tuning scopes that really help. In addition, there is some software written by third-party that allows you to transmit pictures concurrent with keyboarding.

Clover is a neat mode since it allows you to operate in apparent full-duplex mode; i.e you can type while you are receiving text or data.

It is also a very robust mode. It takes some major downturn of the band or lots of QRM to kill a link.

I have found activity on 20, 30 and 40 meters. You will find most activity at 65.5 KHz up from the lower band limit and sometimes on either side of those frequencies in 500 Hz increments. The activity is mostly on week-ends, but you will find some activity also during the week. The popularity of Clover seems to be growing, so there are lot of new station on.

It is a neat mode - check it out.

Don't know the Tucker tuner, but my MFJ-948 had a bad coil. After some
months of operation at 100 Watts (it is rated at 300 Watts), the coil
overheated and two windings shorted. That caused more heat and stability
problems with the tuner - in the midst of some rare DX, of course :-(

I now use the MFJ-948 as a (expensive) antenna switch.

The TS-850S was one of the best on the market for the price range a few years ago (maybe still is)
The receiver section gave you essentially the performance of the Kenwood top of the line TS-950
for much less money. You can add bandwidth filters on both IF frequencys as well as several other accessories. I have one and quite pleased with it.
As for mods, I think there are some such as , I think, keeping the RF stage in the circuit on the medium wave broadcast
band, but I'm not familiar with the details
Jim.

From: alaska2053@aol.com
Message-ID: <4ouec6$n9j@newsbf02.news.aol.com>
Source record: 200179

Hi,
Just a word of warning , it may have been discussed already. If
you use an aluminum nmo to so239 adapter for your mobile antenna setup
check it regularly for corrosion. Lubricate it with one of the conductive
aluminum greases often. Mine froze together I needed to cut the adapter
apart to get my antenna and the retaining nut for the mount back. Not much
fun at all.

BTW no amount of heat I could generate with a propane torch could melt
the salt (oxidation) to free up the adapter.

Right you are, if you don't like what you hear on the radio turn it off. If big bussiness needs spectrum, let them get it from the feds, leave hams alone. And ball parks, baseball football or otherwise should be knocked down and turned into flying fields for model planes, or made into go kart tracks.

At the risk of being redundant, does anyone know if the list for these freqs include 33cm, and if they do, write your congressman, and tell him that that would be a great band for LEO, and alothough we'll shed some tears, we'll be better off in the long run. In fact, no reason to move SSTV, if they're willing to not interfere with, and accept interference from LEO equipment. We picked up this band back in like, 1986, I believe, when all the trouble started. We would be more than happy to shed it. I personally, believe that SATAN lives in that segment of the band, so if the feds want it back, they can have it. Tell me it's on the list for consideration. 73.

>KF4AUY/AAT4AD
I have the short two page manual for this if you need. I think it is
a good little antenna.

If you already have the manual:
If I remeber correctly, all I did was keep measuring swr until it was
at a minimum in the middle of the band. Any swr meter will work, all
you are looking for is a minimum not an exact measurement. Keep
sliding the little bar on the ring until it is at a minimum and then
screw it down tight enough to keep it from moving.

Message-ID: <199606031130.HAA27820@serve.tech.mis.cfc.com>
Source record: 200184

Thanks to all who answered questions about the ft50r..
I bought one...

It has been a long time since I have done much HTing,
but performance on the ducky is real iffy..

Is that normal?

The radio is much better if it is sitting on top of
the refrigerator, or my car roof..

It is even better plugged into the wall charger.

Do I need a better antenna or is their a possibility
that there is something wrong with the radio?

I took it over to the store where I purchased it, and it
seems to work just like theirs, and there is this growing
rememberence in my head of a magnate mount antenna I used
to use of 2 meters with my ht220 years back..

I've been using the MFJ Deluxe Versa Tuner II (MFJ-949D) for several years. I am quite satisfied with it...nice cross-needle illuminated meter, etc.

One thing...when I got it it had an intermittant problem. When I took the cover off I found that the top of one of the coils was touching the cabinet and shorting out. After fixing this, no further problems.

Source record: 200187

Does anyone have any data on the Plantronics
"Starset" type headsets.

They are the kind that look like a hearing aid
with a clear flexible tube that goes into your ear
and a clear rigid tube that extends down toward
your mouth for speech.

The ones I have are designed for telephone
operation with 2 parallel 1/4" ish 2
conductor phone plugs (please don't flame me I
know they are not exactly what I called them but I
use that as a description).

There is a small circuit board contained in the
plug case comprised mainly of an IC either blank
or containing numbers making no sense to us
mortals.

I have modified several to work in Broadcast
intercom systems that accept carbon mic inputs
(mod is a single 3 conductor phone plug).

The things are very comfortable to wear for
extended periods and I would like to put one on my
HF rig. My question is: The mic element appears
to be a dynamic type element. Can the board be
used as a pre-amp by supplying phantom power and
has anyone done it. The are 2 diodes across the
earphone that function as clippers for excessive
audio.

Any info would be appreciated

Hi Paul, Bob,

I agree with Paul's suggestion to try a rig first and see how bad the ignition noise is. I used to have a '92 Saturn SL, which was dead quiet electronically - not a crackle even on weak signals on vhf fm (no hf experience, though). Recently I got a '96 SL1 and was surprised by the high noise level. Luckily for me, the interference was so severe that it troubled the broadcast band radio in the car, and so I was able to tell the dealer to fix it under warranty. In the case of the '96s, the cure is to change the ignition leads - in my case the noise almost completely went away. However, I must note that now (a month or so later) the noise does seem to be getting slightly worse again - will have to wait a while and see if its my paranoia, or if it really is coming back.

This seems to be Saturn day on this newsgroup!

I just did an in-dash installation of an IC2000 in a '96 SL1. I just had the stock radio/cassette, so there was a small compartment below which was just large enough for the rig. To access the compartment, the plastic insert tray jsut pulls out (bit of jiggling around). You will then be able to see whether or not your rig will fit in the space available. If your rig will fit (maybe with a bit of removal of the plastic surround), then:

Remove foot-well access panels. Remove pop-studs which secure plastic surround to the radio console. Remove surround (switch block on top for defrost, etc, should come off easily once you've started to remove the surround. Now you can get at the radio and the space below it. I found it necessary to remove the radio to do a little metal-bending so that there was enough depth to take the IC2000. I used a couple of bolts through the side metal plates into the IC2000 heatsink to firmly anchor it (although its such a snug fit that was probably overkill. I also mounted a miniature fan on the back of the heatsink, splicing it into the broadcast radio power via a small switch mounted next to the cigar lighter socket - there is only limited air circulation behind the radios, so it seemed a good idea to add some extra circulation for insurance. In fact, in use the fan hasn't been necessary, but then I'm not the sort to take 20 min overs running 50W (usually!). At the moment, power is taken from the accessory circuit, a future project is to feed cables directly to the battery. Antenna is a quarter wave, trunk mounted (xyl vetoed other options!). It was a reasonably simple installation, took me about a day's work, on and off.

One problem which I had to begin with was excessive noise from the ignition system. Replacing the ignition cables seems to have cured this, although I'm beginning to notice some noise starting again - not sure whether its my paranioa, or the problem really is coming back. Time will tell.

A nice replacement antenna for the Yaesu FT-50R is the Icom NAS270A which is a Dual Band SMA antenna, flexible and about half the length of the stock antenna.

You can order it directly from Icom for $18.00 + shipping.

Sorry, but I don't have the number for Icom at the moment.

Ty

3412. Extended receive for FT-5200

Date: 1996-06-03 00:00:00 UTC
From: Jonathan <jon@drs-grp.demon.co.uk>
Message-ID: <3WW1vCAQ4wsxEwbm@drs-grp.demon.co.uk>
Source record: 200194

Are there any ways of extending the receiver's range on 2m and 70cm? There was nothing mentioned in the manual, which is to be expected. I have tried pressing different buttons whilst turning on to (this works with the FT-41R).

I have found out from the dealer that you can cut some jumpers inside of the transceiver to extend the range, but surprise surprise they want 60 quid for it. Does anyone know which wires to cut or anything else that can be done?

Thanks.

G7UWY

3419. Re: electronic dog collars (fenceless fences)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-03 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <4ove66$rh9@pacific.mps.ohio-state.edu>
Source record: 200201

I've had an underground fence for about ten years to keep my labrador retreiver on the property. The fenced area is about an acre, and works well. A lightning strike in the neigborhood destroyed the transmitter, and in order to fix it I reverse-engineered the circuit board to see how it worked. Basically, the transmitter was two 555 timer chips configured as oscillators. One oscillator had a frequency in the 100KHz range, and it was modulated by a second oscillator in the 1000Hz range. (I may not be remembering the frequencies exactly, but they are right order of magnitude.) The modulated square wave drove a push-pull transistor amplifier whose output was applied to the buried wire. I understand that the company who thought up the scheme had their patent rights expire recently, which is why there are now numerous competitors in the market and vastly lower prices. THe competition seems to be more sophisticated than the original company, with micoprocessor controlled receivers in the dog collars.

The fences work very well, but are subject to burnout from lightning and, more commonly, from wire breakage. The wire in my yard breaks about twice a year. I find the break by feeding a modulated broadbast band signal from a signal generator into each end and walking around the yard with a walkman. I can usually find the break within about two feet.

Hiyall,

I'm looking for some background info on the mid-70's vintage Yaesu twins, the FL-101 Tx and FR-101 Rx. When were they made/sold, how much did they cost, were they popular, how do they compare to the Ft-101 series of transceivers performance-wise, that sort of thing. I know that there were both digital and analog readout versions of the FR-101; was there ever a digital version of the transmitter? Does the FR-101 use the same 6 and 2 meter converters as the Ft-101? The FM board? I'd like to talk with anybody that uses this gear. TIA.

All MFJ tuners are of comparitively poor quality. I use their smallest, el-cheapo, no meter, no switch tuner in my van that I got for almost nothing. It works because:

1. My swr is low anyway.
2. I run less than 100 watts.
3. I don't care!

All their tuners are toys. I've had their bigger ones and they always arc on certain bands. Their little cheap baluns melt. I had a 941 and to make it work on 160 meters I removed the lid. Yes, the coil is crammed in their vertically! The lid is so close to the end of the coil that the inductance is greatly reduced not to mention the extra losses.

Alas. What to recommend? Some of the old Dentron tuners were better built. Look for them at a hamfest. I have a Drake MN7 that's built like a tank. You can pick these up for around $125 or so at a hamfest. Want mine?

There still is...it's the LM1800 (still around after 15 years). If you have a
WWW browser available, you can download the data sheets from National
Semiconductor's part database (http://www.natsemi.com or http://www.ns.com
your choice). You need Adobe's Acrobat Reader in order to see the specs,
though....

They are only $35 out here.

They will take out multiple (so far, all I can test is 2) heterodynes simultaneously and the CW sharp (narrow) mode is better than the CW narrow filter in my TS-430S.

I approve. I bought a spare.

What I mostly wanted is the elimination of 'whistles' as they call them on the box and it does that quite well! The rest is gravy and for the price, it is quite nice.

I just leave it in in wide mode unless I need to tighten down a bit.

I do not notice any additional noise from the unit yet. The bands have been a bit noisy lately.

It does! Press the band key and moni key while turning the unit on. Now when you step through the band (band key) the radio will go to 144, 300, 430, and 800MHz (cellular block). Also there is a programming kit available for the IC-T7A that allows you to program all the features of the radio from a PC computer. The kit includes the software and cable.

3456. FS: TI C5x DSP Starter Kits (DSKs)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-04 00:00:00 UTC
From: cole@netcom.com
Message-ID: <coleDsGK8r.I3A@netcom.com>
Source record: 200045
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I still have a few TI 320C5x DSKs (DSP Starter Kits) for sale. The TI part number is TMDS3200051. They are all brand new and have never been opened.

These kits are designed for students, experimenters, and developers who need a simple, low-cost way to prototype DSP-based applications for the TI 320C5x series of DSP chips. The kit includes a small (2.5" x 4") PC board with a TMS320C50 processor, a TI Analog Interface Circuit (AIC) chip with 14-bit A/D and D/A capable of sample rates to 19.2 K samples/sec, RCA jacks for analog I/O, and a 9-pin RS-232 host interface. The kit also includes a simple assembler, loader and debugger for the PC, a kit manual and a TMS320C5x manual.

The latest versions of the software as well as several user-written demo programs can be downloaded from the TI BBS, accessible via TI's FTP host ftp.ti.com, in directory /mirrors/tms320bbs. The board requires a 9 volt *AC* power supply capable of >250 ma. A 9 VAC 780 ma supply with the right plug is available for $8.99 from Radio Shack (Part # 273-1630).

TI sells these through distributors for $99, and purchasing them through distributors can be a hassle. I'll sell them for $60 each shipped within the US. Terms: Price is firm. The units are guaranteed against DOA. Immediate shipment if payment is by USPS or other money order or cashier's check. Personal checks are OK but I'll wait for them to clear. No CODs, please.

> this?

My fault... I was repeating what the salesman told me (RTFM, right?).
Years of
"the big battery" always being 12V has stuck with me, also. It is indeed
a 9.6V,and the output is 4W VHF, 3W UHF. On the "Specifications" page,
output with 13.5 is listed as 4W/0.5W VHF, and 3W/0.5W UHF (no different
from the 9.6V battery). External DC is listed as 4.5 to 16V DC negative
ground.

Sorry for any confusion!

You have a major problem with the method mentioned in the reply
below...

The antenna feed point is no longer at the ANTENNA CONNECTOR on the
handheld, but at the OUTPUT CONNECTOR of the bridge in series. At UHF
and VHF frequencies, the added physical length of the bridge changes
the frequency/load of the antenna AND Bridge.

Somewhere Motorola published the chart to calculate jumper cables;
where the length of the coax jumper changed with frequency/band to be
checked! The lengths were calibrated/calculated for the width of a
Bird Model 43 Wattmeter (4" plus connectors).

Yes, I am correct. I took the time to find the book and it is the
1971 MOTOROLA COMMUNICATIONS PARTS & DATA HANDBOOK.
Page 28 specifies a 24" length of RG-8 at 146MHz and 5 1/2"
jumper at 445MHz, as calculated from the nomograph. Measure
'tip-to-tip'.

Rubber Ducky antennas are noted for dubious performance and radical
matching. The article noted that any VSWR higher than 1.5 makes VSWR
measurements even more critical.

Calibrate your VSWR Bridge with the correct jumper and see true
measurements/performance.

>CTCSS "subaudible" is a bit of a misnomer, you can hear it, but it is not
>very loud... more like a light buzz.

The term subaudible is correctly used in radios properly designed for it. These units include high-pass filtering in the receive audio section to prevent CTCSS tones from coming through to the speaker. The idea was that since all the tone frequencies are below the human speech frequency range, a filter could be used without effecting voice quality. Many ham radios do not include this filtering, thus the tone noises. Also, it is important to make sure that the tone modulating the transmitter is clean (free of harmonics). Often, the "buzz" which is heard are harmonics of a dirty tone generator.

Rob,

Not yet! I've had my FT-10 (which I dearly love) for several months. During that time I've checked every electronic parts source known to me (local, catalog, regional, etc....) with no luck. I eventually broke down and bought both an adapter (for use with a TNC) and a speaker mic. I'm still looking for the plug for some other projects. Yaesu said the plug would be available as a part sometime in May, but when I called last week that was not yet for real. If (when!) I find it, I'll let the world know...

Let's all be perfectly clear about this. NONE of the tuners produced today are properly rated. The reason is simple, and contrary to what has been stated Dentron was a major contributor--not the pillar of honest ratings. How do I know? I have done consulting work for many of the manufacturers and personally know the people that wrote advertisements, and that included the owner of Dentron. I have pressured several manufacturers and advertising departments on this issue, all to no avail.

The power rating system used for tuners today stems from years ago when transmitters were rated by dc input power. For example, the SB-220 and L4B were designed (and this is first hand knowlege) as 1000 watt dc input CW amplifiers (500-600 watts RF carrier output). These amplifiers were called 2 KW amplifiers, because on voice peaks the dc plate input could reach 2000 watts (the actual design PEP output was 1000-1200 watts peak).

Tuners still follow that "system". Even though amplifier ratings changed, tuners never changed with them. A 2000 watt tuner is typically designed to operate with about 600 watts of RF carrier throughput under ideal conditions.

Dentron, makers of some of the least efficient amplifiers, moved the rating up a few notches. Some of their amplifier ran 3000 watts PEP input and delivered 600-700 watts CW output. Because of that, and just to keep things in perspective, everyone else increased their ratings.

The final result is true RF power handling of almost any tuner is about 1/3 to 1/2 of the "advertised or name value". But it keeps getting worse. Let me give a few more examples.

The Vectronics 3 kW tuner uses the same troublesome roller that MFJ recently abandoned, and SMALLER capacitor plate spacing. It handles even less power uner the same load conditions. Of course you could buy a patented $1000 tuner with NO warranty that uses the same roller size as these tuners (but on a higher melting temperature ceramic form) and doesn't even have the case properly grounded. That one will squeak by at 1500 watts with a high Z load, except you get no balun or balanced output.

In my opinion, everyone should DEMAND tuners be rated by the true RF power capability under a given set of conditions, and not some nebulious system that means absolutely nothing.

The power rating system used by ALL tuner manufacturers today means absolutely nothing, it simply indicates the capacitor size. Many amateur equipment ratings (I'm still upset about the useless weight control and the character shortening on QSK CW in my IC 706) are almost worthless. The problem is bigger than one manufacturer, and it will continue to grow.

The truth is, if someone made a good tuner and advertised it truthfully, no one would buy it. It would look like too little for the money.

73 Tom

I'm no fan of most MFJ equipment, and their tuners do indeed sound like junk. However, I'm very impressed with their antenna analyzer and with their top-loaded 80 meter ground-mounted vertical. Good workmanship in both cases and a reasonable price.

FWIW, my favorite tuner is the 1 KW version of the Johnson Matchbox, which will easily handle maximum legal power continuously and which is still widely availably on the used market. I just saw one on rec.radio.swap today in fact. My other favorite, which is in current production, is sold under both the Vectronics and Tucker brand names. This also handles maximum power easily, with no discernable heating even after 1500 watts contiuous output on RTTY for many minutes. The Collins 180S-1 is also a nice tuner, although you need to add a balun to feed balanced line.

No, they are bias-powered. The carbon microphone simulation you have
built is exactly how they operate when connected to a telephone as
originally intended. Any voltage from 8 to 48 VDC should work OK, as you
have already discovered.

Now you know the purpose for most of the electronics on the PC board -
it's an audio amp. You are correct about the signal limiting diodes on
the receive side - leave them in place and protect your eardrums from
static crashes!

X-Newsreader: Microsoft Internet News

Operation of a non-type accepted radio such as an amateur transceiver on
marine or other private radio frequencies is a violation of FCC Rules.
The FCC warning notice below specifically mentions the 10M CB problem, but
the rules quoted also apply to extended transmit capabilities beyond the
2M and 430-450 ham bands.

These types of notices usually mean some forthcoming action from the FCC.
We'll see if they actually order manufacturers to stop making amateur
radios capable of being opened up for all band TX. This may finally be
the start of new enforcement action to control illegal operation of
amateur equipment.

PUBLIC NOTICE
FEDERAL COMMUNICATIONS COMMISSION
1919 M STREET NW
WASHINGTON, D.C. 2055462882

News media information 202/418-0500.
Recorded listing of releases and texts 202/418-2222.

May 13, 1996

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the Commission's
Rules regarding equipment that is intended to operate in various radio
services in the high frequency radio spectrum, including "10-Meter"
Amateur Radio Service (ARS) equipment.

The Commission has noted that a number of transceivers imported as
ARS equipment are also capable of transmitting and are being operated in
nearby frequency bands allocated to other radio services such as the
Private Land Mobile Radio Services, Maritime Services, Auxiliary Broadcast
Services, International Broadcasting Services, the Citizens Band Radio
Service, and the U.S. Government. Operation of this equipment causes
interference to the authorized users of these frequencies. Some of these
transceivers are capable of using output powers or emission types which

are not permitted for the radio services listed above and some are capable of transmitting in the radio astronomy band where no two-way radiocommunication is permitted. Some manufacturers are promoting the sale of conversion kits, or have designed their transceivers such that they can easily be modified by the users, to extend the operating frequency range into the frequency bands listed above. In addition, so called "export" radios which are deliberately designed to facilitate this capability are also being imported and marketed.

Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use. The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required, because of the simplicity of modifying them to extend their operating frequency range. Transmitters designed and intended for use only in the ARS must comply with the applicable technical standards contained in Part 97 of the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to:
(1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio service(s) in which the transmitter is capable of operating;
(2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued; or,
(3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission-issued station license.
Violation of the Commission's regulations will subject manufacturers, importers, vendors and users of this equipment to appropriate criminal penalties as provided for by federal law(s), including fines and/or imprisonment. In addition, the equipment described above can be seized by, and forfeited to, the government.

For further information concerning this Public Notice, contact Gary Hendrickson at the FCC Laboratory, 7435-A Oakland Mills Road, Columbia, Md. 21046, (301) 725-1585, Extension 223, or E-mail: ghendric@fcc.gov.

bruce varley wrote:
>
> I am looking for the most compact possible HF SSB set, for backpacking
> into remote areas. Needs to have sufficient power for moderately
> reliable communication up to several hundred Km.

As you probably know, completely reliable HF communication to hundreds
of km is very difficult. It depends on atmospheric conditions, time
of day, and the frequency you select. Usually, you can select an
HF band that will do the trick for a particular time, but not always.

> Full band coverage
> not required, but one good day and one good night band would be
> beneficial. Envisage using wire antenna such as a halfwave dipole.

If you want high reliability, I would select a rig capable of
working all the HF bands.

What will be your power source? There are lots of very small
HF rigs on the market today (Icom 706, Kenwood TS-50, Alinco,
Ten-Tec Scout), but the problem with size and weight is the power
source. If you are backpacking and are not interested in hauling a
big 12v battery, your choices are limited.

There are small battery-operated HF rigs on the market, some of which
are inexpensive and/or kits. MFJ sells a full line of assembled units
for SSB and CW, but I believe all of them are single-band. Ramsey
also sells inexpensive kits. A good catalog is located at www.tucker.com.
The problem with these battery-operated systems is low power (usually
1 or 2 watts); the best mode for QRP power levels is CW (morse code).
You can reliabily communicate at this power level, but you need to
develop some CW skill.

>They will take out multiple (so far, all I can test is 2) heterodynes
>simultaneously and the CW sharp (narrow) mode is better than the CW narrow
>filter in my TS-430S.

I'll second that and I have a 250 hz filter in my TS-430 which rings,
attenuates, and sounds weird. The Radium Shack DSP does none of that
and works as good or better for CW.

A couple of comments on my recent purchase for $35:

The headphone jack is MONO! I had to move one of the wires on my headphone
plug to get both ears working.

The freq. response WITHOUT the DSP on is 300-3000 hz which is not good
enough for me.

The 5 watt amplifier has about 10% distortion which is noticable to me.
I'll have to build a switch to cut the thing out and run the audio direct
to the speaker when I don't need the filter.

The DSP distorts voice audio a little on all modes and all width settings.

Message-ID: <4p25o1$dn6@pulp.ucs.ualberta.ca>
Source record: 200127

Hi,
I am looking for a decent non-amplified handmic or deskmic for my Drake TR7. I thought that the Shure 404C handmic or the Shure 444D deskmic would be good bets. HRO had the 404C several months ago, but no longer have them. Univeral Radio has the 444D in their newest catalogue, but I just talked to them, and they said that they were sold out, and that Shure were no longer making this product. I have not had much luck finding other non-amplified mics that might be suitable. All the available mics are designed for the big three. Does anyone know who might have some of these Shure mics as old stock, or any recommends for another suitable mic?
Thanks,
Chris VE6RDC

********** 2 Meter AND 70 cm BANDS THREATENED
****

THIS IS NO JOKE!! ARRL HAS LEARNED THAT IN
PREPARATION FOR THE
WORLD RADIO CONFERENCE IN 1997, REPRESENTATIVES OF THE
LOW-EARTH-ORBIT
(LEO) INDUSTRY PROPOSED A LIST OF CANDIDATE
FREQUENCY BANDS FOR
REALLOCATION TO, AND EXCLUSIVE USE OF THE MOBILE SATELLITE
SERVICE. THIS
LIST INCLUDES 144- 148 MHZ (THE CURRENT AMATEUR 2 M BAND)
AND 420-450 MHZ
(THE CURRENT AMATEUR 70 CM BAND)!
IF THIS EFFORT WERE TO BE SUCCESSFUL, IT WOULD
MEAN THE END OF
AMATEUR OPERATIONS ON THESE TWO MOST HEAVILY UTILIZED
AMATEUR VHF/UHF
BANDS!

I have included the text of Dave Sumner's upcoming
editorial for
July QST in this bulletin. ARRL, as the principal
representative of
Amateur Radio in Washington, is actively pursuing this
issue as this
bulletin is being written. Dave's call to action is
serious!! We could
lose these bands if we do not take action now!!

Club presidents and newsletter editors:
please make this
information available to your membership as soon as
possible.

Follows the text of Dave Sumner's July QST editorial:

WRITE NOW!!!!

Get out a pen and paper, or boot up your computer.
There's work to
be done! Your help is needed to defend two meters and
70 cm. Yes,
that's right -- the two most popular and crowded amateur
VHF/UHF bands!
But don't panic, and don't "go ballistic."
Here's what's happening, and what you can do about it.
The United States is preparing for the 1997
ITU World
Radiocommunication Conference, WRC-97. In the past, the
public has been
able to participate in the preparations for such
conferences by
responding to FCC Notices of Inquiry. In March, the
FCC announced a
streamlining of its International Bureau's preparatory
processes for
WRCs. Under the new scheme, the NOIs have been
eliminated in favor of
increased emphasis on WRC Advisory Committees.
For WRC-97, a series of Informal Working Groups
(IWGs) of the
Advisory Committee has been created to address specific
agenda items.□
The output of each IWG will go directly to a joint
FCC-NTIA-Department of
State Steering Committee of the Advisory Committee.
There, draft
proposals as received from the IWGs will be reviewed and
forwarded to the
FCC for possible release as preliminary U.S.
proposals for public
comment.
In announcing the streamlined WRC preparatory process,
the FCC tried
to reassure those who might be concerned about reduced
opportunities for
public participation: "Interested parties should note
that input to the

Advisory Committee may be sent at any time directly to the Chair of the WRC-97 Advisory Committee; the Chairs of the Advisory Committee's Informal Working Groups; Cecily C. Holiday, the FCC's federal officer of the WRC-97 Advisory Committee, or to Damon C. Ladson, the alternate federal officer."

Hold that thought while we shift gears to the substance of the issue.

One of the WRC-97 agenda items includes consideration of possible additional frequency allocations for the mobile-satellite service.

So-called "little LEOs," low-earth orbit satellites below 1 GHz, already have allocations. Their proponents claim these are inadequate and are trying for more. The needs of little LEOs are being addressed in IWG-2A, chaired by Warren Richards of the Department of State. The ARRL☐ technical relations staff participates in IWG-2A to represent Amateur Radio interests.

At the May 7 IWG-2A meeting, an industry representative proposed a list of "candidate bands" for little LEOs. The list includes a number of bands that would negatively impact existing services, and does not include others that would be technically more feasible but to which strong objection from incumbents could be expected -- the point being that some political, rather than purely technical, judgment already has influenced the list.

Incredibly, 144-148 and 420-450 MHz were included on the list! This is the first time in memory that another service has been proposed for the two-meter amateur band. We must make sure it is also the last time.

We do not need to explain to ARRL members the extensive use that is made of these bands by amateurs. The two bands provide

the backbone of
our local public service communications effort. Voice
and data, mobile
and fixed, even television -- the list of present amateur
uses is a long
one, and of future uses is even longer. Both are
already used for
satellite services and for moonbounce and
extended-range terrestrial
operations requiring extremely sensitive receivers and
high levels of
effective radiated power.
Apparently we did need to explain all this to
the little LEO
industry representatives, so we did just that -- both at
the meeting and
in a followup letter on May 15. We also explained that we
had to regard
the matter as extremely serious. No one with the slightest
background in
radiocommunication could possibly believe that a
mobile- satellite
service could be introduced into either band without
disrupting existing
and future amateur operations. Therefore, we said, if we
did not receive
assurance that they would be taken off the list of
candidate bands by the
deadline for this issue of QST, we would have no choice but
to bring the□
matter to the attention of the entire membership.
The response we received was unsatisfactory. In
effect, we were□
told the little LEO industry would consider our views
but that until
their spectrum needs are satisfied, all bands must
remain under
consideration.
So, this is a call to action. We must get across
to the industry
and government participants in IWG-2A that the 144- 148
MHz and 420-450
MHz bands cannot be considered as candidates for
mobile-satellite
services. We need to drive the point home so forcefully,
with so many
grassroots responses, that no one is ever tempted to try
this again.
Which brings us back to that invitation for

"interested parties" to
send input "at any time." There's no time like the present!
Here are the
key addresses, including those of the mobile-satellite
industry folks who
seem to have started the ruckus:

Cecily C. Holiday, International Bureau, FCC, Washington,
DC
20554; choliday@fcc.gov; FAX (202) 418-0748.
Warren G. Richards, Chair, IWG-2A, Department of State, CIP
2529, Washington, DC 20520;
richardswg@ms8620wpoa.us-state.gov; FAX (202) 647-7407.
Tracey Weisler, FCC Rep., IWG-2A, International Bureau,
FCC,
Washington, DC 20554; tweisler@fcc.gov; FAX (202) 418-2824.

Mary Kay Williams, Final Analysis, Inc., 7500 Greenway
Center, Ste. 1240, Greenbelt, MD 20770; FAX (301) 474-3228.
Leslie Taylor, President, LTA, 6800 Carlynn Court,
Bethesda,
MD 20817; ltaylor@lta.com; FAX (301) 229-3148.

Do comment. But be civil. Don't abuse people who
are simply doing
their jobs. We have to get across that casting covetous
eyes on amateur
bands is counterproductive, and contrary to the public
interest. To
accomplish this we need a lot of comments, including yours.
But remember
that the objective is to educate and persuade, not to
intimidate. We
don't need to. The facts are on our side.
To monitor the FCC's ongoing WRC-97 preparations,
visit its WRC-97 home page at:
http://www.fcc.gov/ib/wrc97/.

Interesting country you have there.
Questions:

1. Who is going to know the difference?
2. Why would they believe you if you told them it didn't cover HF?
3. Does it still qualify if you can easily change it back to cover hf?

I use the 706. It's a nice rig. 73

: Hello everybody.

: I have bought a IC 706 and in my country I only can use it in 144 Mhz
: with my licence. I need to modify it to only have full coverage onn 144 Mhz.

: Do you know the mods to turn off the HF bands on this transceiver ???

: Any comments are welcome. 73s

Let's put a halt to all the inaccurate speculation and wild guesses. The
radio features are as follows:
110W out (20% duty cycle - 1 min on, 4 min off)
12 VDC negative ground ONLY, maximum draw is 35A in Tx
Freq Range: Somewhere in the 136-174 MHz window
Band Splits are 136 to 150.8, 150.8 to 162, or 162 to 174 MHz
You'll have to provide part numbers of exciter board and receiver
front ends to define which window for each.
Radio is NOT equipped with coded squelch
Radio has noise blanker on receivers
Radio has dual (wide spaced) 4 channel exciter -
Max spread is 5.5 MHz limited by tuning of driver stage
Radio has dual (wide spaced) 4 channel receivers
The rcvrs could be two different band splits, but usually in same one.

Manual number for basic HB MICOR is 68-81008E40
Supplement for Extender is 68-81011E95
Supplement for WideSpace Xmtr&Rcvr is 68-81014E15

Source record: 200138

I am not aware of any HAM H.T.'s that will decode Quick-call II.
Most HAM rigs have CTCSS (p.l.) decode or DTMF (touchtone) decode
but neither is compatible with Quick-Call II. There are some Motorola
H.T.'s & Mobiles (as well as other commercial brands) that will act as a
normal receiver and/or stay muted until receiving the appropriate QC-II
alert tones. Models include GP-300, MT-1000, HT-1000, MT-2000 & VISAR
for handhelds. The Maxtrac mobile with high signalling options will both
encode & decode Qick-Call II. I heard a rumor that Yaesu was comming out
with a ham rig that would decode QC-II, but I have not seen it yet.

Hope this helps.

Mike

$35 here too. Bought the last one at the nearest store. A few months back I bought one for $50 and spent a few hours with it and was unable to detect any audible effect at all. Took it back. Now realize the DSP switch was broken (or something), as the current one has been quite wonderful for heterodynes and the filtering is quite noticeable. Looking forward to coupling this with the direct conversion receiver I'm building as I think it may make a very effective combination, filter-wise. Building the $29 Ten-Tec for my mother as a birthday present. She turns 76 and after playing with Super Morse for a few months wants to hear some "real CW". I'm not making this up. She'll shame me up to 20wpm before this is over. But if the RS is worthwhile for her CW reception, then I've got to find *one more*: Can't live without the heterodyne killer now :-)

Regards,
Pete

Hi Chris,

I was just curious after reading, so I checked and shure has a
web sight and shure enough they don't list the microphones your asking
about. However they do list a 527B (Omnidirectional Dynamic Handheld
Low Z w/PTT) I don't know if this helps. But check out their web
sight.

Hope this helps 73 Ed/N8OYY

3508. ICOM CI Parts

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-04 00:00:00 UTC
From: tomms@mnsinc.com
Message-ID: <4p1m9p$fn@news1.mnsinc.com>
Source record: 200147

I just bought an IC 738 and I am looking for a schematic for an interface to my computr. I have a schematic in the new handbook, but the parts supplier (CW Technologies) seems to be out of business. They use a Harris IC232 Level converter. This project could also be done with two Radio Shack parts (TTL-RS232 converters). Does anyone have a schematic? It seems kind o silly to pay $100+ for a few chips and other components from ICOM.

Thanks,

Tom NY4I

Come on guys, have you ever heard of the concept of "satire"? It
often angers precisely those people who most need to understand the
underlying message. Or perhaps those people get angry precisely
because they *do* get the underlying message, and they don't want
to admit that it strikes a little too close to home.

Perhaps it's time to have another serious discussion
on just what the amateur service is supposed to be about and how
we can continue to justify our frequencies in a rapidly changing
world. But I fear it will just devolve into name-calling. Sigh.

For the record, no, I don't want to see 2m and 70cm turned over to
the LEO operators. But I have to admit that there's more than a
kernel of uncomfortable truth in what everyone has labeled "flame bait".

Phil

3512. Re: CDR Ham M rotor??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-05 00:00:00 UTC
From: "William O. Reichert" <billnihh@apci.net>
Message-ID: <4p3sdl$6su@queeg.apci.net>
Source record: 199966

Have used lots of HAM-M and its later models, the HAM-III and HAM-IV. Not sure what the max wind load is, but I used one to turn a TH-6 stacked with two 6 el 6 meter beams, and another with a 4 el 20 mtr monobander with a 24 foot boom, an 88 element two meter array and a Ringo Ranger. For a while there was also an 80 element 432 collinear on that one.

There were a few HAM-Ms made with fiber gears; if you can, you will want to stay away from that, but the only way to tell is to disassemble and look as far as I know. It is possible to chew the teeth out of the gears, then they have to be replaced. Hy-Gain/Telex is pretty good about replacement parts. By the way, the actual rotor assembly is virtually the same from series 5 of the HAM-M to at least the HAM-IV. The difference is in the control boxes. The HAM-III and IV have the ability to release and reengage the brake separately from the motor control. In the original HAM-M everything happens at once, controlled by the lever switch at the bottom of the control box. This can cause problems as when the switch is released, the motor still has some momentum, which the brake stops immediately. This produces torque on the support structure on the brake wedge and the teeth cast into the bell housing. I have seen brake wedges sheared off and the teeth in the bell housing chewed out.

With the lated units, the brake is released then the rotation button is pushed to turn where you want. You can then let the load glide to a stop before reengaging the brake. This is a simple modification to make on the HAM-M, requiring a small switch to control the brake separately.

Other possible problem: in some early HAM-M it is possible for the grounding arm of the directional potentiometer to corrode, causing intermittant and erroneous bearing info. Disassemble, clean and add a piece of braid from the ground of the pot to the bell housing. It can only turn one revolution either direction so only a little slack in the braid is required, especially if it is centered when you start.

There are lots of ball bearings between the two halves of the bell housing in a platic trace. There will be grease all over them, so a little sticky. On disassembly these ball bearings like to go about 57 different ways, so some care is required.

Only other thing I can think of is to keep the load centered over the mid line of the rotator. Side ways play will wreck one quicly.

When I had to take down all my antennas for a move, one of my HAM-Ms was over 25 years old, and as far as I know, the fellow who got it is still using it. Very little maintenance required in that time.

The Ten-Tec auto tuner is the best tuner I have used for matching a wide range of feed resistances. It works like a charm with open-wire feeders and antennas like double extended zepps. My MFJ and Nye Viking tuners merely choked on trying to match such systems. Unfortunately, Ten-Tec no longer produces this tuner and if you have one, hang on to it! I'm sure not going to get rid of mine.

I would recommend that you consider having the 75A-4 repaired and aligned
by Howard Mills W3HM. He's on Harper's Ferry WV and is *THE* number one
authority on the 75A-4.

There is also Dave Knepper W4BJZ in Western PA who is the publisher of THE
COLLINS JOURNAL. He does repair work for very reasonable fees. I highly
recommend his monthly newsletter on Collins equipment.

I have not had any work done by either of the two individuals listed above
and have no interests in their repair business. I pass this information
on for what it is worth.

Please give me your recommendations on the FT-50R. I am new to ham radio and want to get a HT that has lots of features and a good value.

Can anyone tell me about the SMA antenna connector? Is this standard like the BNC connector? How hard is it to find adaptors for BNC to SMA?

Can you get generic batteries? Any limitations caused by its small size? Where are the batteries connected? (On many of other HT's, particularly those a year old or older, the battery connects to the bottom of the unit.)
Why is it so cheap ($340) compared to similarly equiped transceivers lie the FT-51R($520)?

3520. My Icom IC-T7A Impressions

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-05 00:00:00 UTC
From: "Scott A. Blystone" <kc2iq@frontiernet.net>
Message-ID: <31B596D1.58CB@frontiernet.net>
Source record: 199974

Hi all,

I've been a ham for about 35 years, and so have gone through quite a variety of VHF/UHF gear. Last week I purchased a new Icom IC-T7A dual-band HT to replace my Yaesu FT-530 (a nice radio, but too many bells and whistles for my liking - I was always getting it into some un-known mode or another!). Well, I just wanted to let everyone know that I am really impressed with this little Icom unit. It seems like the perfect combination of features vs. functionality. At first I was a bit concerned about the automatic squelch feature, but it has proven to operate perfectly and is a real convenience. Battery life is quite impressive, and extended coverage (300-400 mHz. and 800-999 mHz.) can be very easily enabled. The extended coverage sensitivity is much better than I expected, in addition. The radio is extremely small, yet very usable, and is, in fact, small enough to carry around with my minitiature cell phone.

3-rd party manufacturers are now beginning to produce battery packs and accessories for it. I was ablt to purchase 7.2v 900mah nicad packs at a local hamfest for half the price of the Icom packs. In addition, these packs are the SAME size as the Icom pack which is only 600mah!

I've only found one really annoying issue with the radio - the keys are not backlit at all, and low-light operation can be somewhat problematic.

I hope this information helps any of you who may be looking at this unit.

If you are looking for a 2M rig I would strongly suggest that you
avoid the HT route. I for one, am really tired of all the guys trying
to hit the repeaters using an HT and a fair to poor antenna. Do
yourself a favor and look at the Icom IC-2000H. It has a pretty good
receiver, 50 watts, plenty of memory area, small in size, and a VERY
reasonable price. Most of the mail order outfits are moving them for
around $260.00 (about the same as many of the HT and it won't have
battery problems). The size of the rig is about like placing two HT's
side-by-side. The extra power will allow you to get into repeators
with a "full quieting" signal and no "drop-outs". Just my 0.02 cents
worth.

Opinions expressed herein are my own and may not represent those of my employer.

It slides onto the back. Nice design!

> Why is it so cheap ($340) compared to similarly equiped transceivers
> like the FT-51R($520)?

Because the FT-50R is only a single radio inside, while the FT-51R
is two complete radios inside (therefore supporting cross-band,
full-duplex, etc.)

Source record: 199979

I've had my IC-706 for about 3 months now. I enjoy the size and multi-band capability.

I sometimes strap it on my motorcycle, and its nice for that. I run mostly CW and have not bought filters for it, yet. I seem to make all the contacts I want, so probably will never get them. I run 40M, 30M, 17M CW mostly, and use the box for 2M.

Only have 2 gripes:
1. ICOM offers a free remote mount cable and logbook with the deal. Well, its been 3 months and no freebies yet. I called them, and they said that the person who does the shiment had quit, they were backlogged, etc. etc. I'm pretty sore about this, cause they got my money immediately, without a 3-month wait......

2. The way the unit uses offsets for repeater use is awkward, and I'm forever "loosing" offset. I jsut have to be careful to make sure and look at the display before using repeaters.

Other than that, I'm happy with the unit...

From: "Gregory J. Buhyoff" <buhyoff@vt.edu>
Message-ID: <31B5DD15.4ADA@vt.edu>
Source record: 199981

I have an IC 736 dedicated to 6 mtr operation. I notice that I don't get much ALC action on 10 and 6 meters at 100 watts of output with the hand microphone supplied with the 736 or with a Heil dynamic element (which requires the gain to be really cranked up). There is no problem with power output. It just drives me a little crazy to not see the needle move at all when the meter is switched to ALC. So, what are other IC 736 users doing for microphones? What sounds good with the tx audio circuitry of the 736? Is anyone using the Icom SM-6, SM-8 or SM-20 and what is your experience. I very much appreciate your time and am grateful for any responses. Please respond to Buhyoff@vt.edu or here if you think there might be valuable thread for others to read.

duck is to do a careful comparison against the
radiation characteristics of a leaky dummy load that
I have. :-) In other words, rubber duck antennas
normally are very poor...usable only because of
the network of amateur radio repeaters. Your mileage
may vary.

: The radio is much better if it is sitting on top of
: the refrigerator, or my car roof..

: It is even better plugged into the wall charger.

: Do I need a better antenna or is their a possibility
: that there is something wrong with the radio?

: I took it over to the store where I purchased it, and it
: seems to work just like theirs, and there is this growing
: rememberence in my head of a magnate mount antenna I used
: to use of 2 meters with my ht220 years back..

Yep. That's why people often use external antennas on HTs.
Watch out for the next problem...the added gain of
a real antenna will provide a stronger signal to the
receiver and expose any receiver performance problems
("intermod") that the HT might have. I don't know
how good the FT-50 is...it might be fine.

IMHO, everything made by MFJ that I have ever seen is junk. Poor quality components, shoddy assembly, and non-existent quality control. It might seem like a good deal, but it's actually kind of expensive for junk. Spend a bit more and get something decent.

I wrote a simple one under gw-basic. You can have it if you want.
With some minor changes it should run under Win qbasic.

> anyone seen a mod for the GX to get serial data out? Any help
> would be appreciated.
You would need a different firmware, that supports the two-way
data transfer. I do not think Yaesu ever released an upgrade
for the GX model.
The GX II firmware, on the other hand, will not support the GX
hardware properly (i.e. MODE switching) so you cannot use it.

============response GM0CSZ / KN6WH
Roland ,you probably mean an electret mike . These are low cost small
microphones with built-in amplifier requiring 1.5-4 Volts -DC.
A number of transceivers (like Ten-Tec Paragon ,Omni etc) have the
required DC voltage at the mike socket. .The external modulation
circuit usually has an audio band pass filter for 300-3000 Hz . The
electret mike element is ideal for making a home brew microphone
,either a desktop or a handheld model. It can be readily built inside
a disused dynamic mike housing with PTT button,by means of a small
piece of strip board along with other components one might need.
For mobile use the tiny mike itself can be fitted in the car cabin
near the driver,often without the problem of picking up engine noise
due to the external audio bandpass filter which attenuates the low frequencies.
The electret mike has about the size of a peanut,with its cost being
accordingly.

This is an unusual request...most people are looking to open up the TX coverage ! I don't know of any CPU ablilty to DISABLE the TX on HF and 6m.
The best (and probably only) thing to do is disable the HF/6M PA which is independant of the 2 meter port.
You can look over the schematic...locate and unplug the cable that goes to the HF/6M PA. I would then connect a 50 ohm resistor (dummy load) to this line to present a load in case of inadvertant transmissions on HF or 6m. There may be something in the realm of 10 or more watts at this point so use an appropriately rated (wattage) resistor and insulate it so that it does not short out to any other circuitry.

Not a simple 'snip a wire' mod but it may get you the appropriate operation that you require to legally use your 706 for your class of licence. You would be wise to measure the HF/6m output with a spectrum analyser after doing this to ensure that any RF that escapes the port is negligeable.

> The Yaesu FT51R can be programmed by the front panel to move the
> volume control function to the knob on top, just as you prefer.

I am aware of that option, but then you give up the tuning knob function. A more
accurate description on my part would have been: There are (2) coencentric
knobs on the T7A, one for volume (the outer ring, easy to work with thumb) and
one for frequency (the inner post, taller than outer ring). The Yaesu, as
I have been reminded, has a programmable _single_ knob. You can pick one
function for it at a time.

In fairness, there is no up/down buttons on the T7A, only the knob to
change freq or memories, although you can enter either memory recall or
freq entry via the keypad. The "band" button initiates scan functions.
You can turn the knob to continue agter a hit, or use the "band" button to
continue, in addition to just waiting.

One irritation: The rubber plug that protects the mike/phone jacks is
permanently connected to the radio. That's good if you don't want to lose
it, but it gets in the way if I have a mike connected. It hangs off the
back, and gets pulled every time I stick my hand in my pocket when the
radio is clipped to my pocket. I have the rubber plug from a 2-SAT that
has a ring that slips over the BNC connector between the radio and
antenna. I'm thinking about cutting off the one on the radio, and using
the removable plug. The less things hanging off the radio, the better.
It has survived some pulling and twisting in normal use, but is really in
the way when not being used.

DSP's don't reduce power line noise very well. Power line noise usually has continuious spikes that "ring" circuits between the antenna and the audio stage. The result is a bunch of sine waves that the DSP doesn't "view" as noise. To the DSP, power line noise looks almost the same as valid signals.

The additional selectivity will help more than noise reduction functions.

Check the audio. I find that the noise level of the audio PA is too high with earphones. With the volume turned all the way down, there is a high frequency hiss. The hiss level is high enough to be annoying when copying CW with headphones is a quiet room, which happens to by my normal environment.

ICOM does not think that there is a problem, and has no plans to fix it.

-> >>I am thinking about buying an MFJ HF tuner (specifically the 300w
-> one >>with dummy load, etc.) Looking on some feedback about them and
-> any

-> I purchased the '3 KW' Differential T-Tuner. Took me
-> about two days before the roller inductor melted into
-> a pile of goo.

I'm just getting into ham, but I just had a slight experience with a MFJ Versa Tuner II. Not really sure how well the tuner worked (had other radio problems at the time) but one thing that I definitely noticed was that the capacitor for the antenna side of the adjustment was rather tight and upon turning caused sporadic, scratchy static. The tuner has gone back to where it came from. Real "tinny" box, also, not heavy duty by a long ways. FWIW.

>This happened all just for "national security" and so was for sure
>properly justified.

Now Tor, let's be careful here. First, do you have any idea how those American civilians residing in Japan were treated by the Japanese government when war was declared between the two countries? No, of course you don't. The American government treated the Japanese-Americans (JAs) *much* better than the Japanese treated American civilians.

Japan was the first government in modern history to invade our soil, and *yes* there were Japanese spies here in Hawaii providing US ship and air movements to the Japanese government. The action the US took against the JAs was justified.

Martial Law was declared here (the military took over all civilian government operations); during martial law all civilian rights *have* to be suspended, and a "shoot first, ask questions later" policy *has* to be implemented for national security and welfare of all. Can you imagine being arrested by the military because you violated curfew or allowed household lights to be seen from outdoors at night? Probably not.

It's fine to be an armchair historian 50 years later but unless you've actually been bombed by an invading force you'll never understand why the US had to take the actions it did WRT the JAs.

BTW, reparations are being made to those JAs who were interned.

Clearly
You jest

LEO use of the existing amateur bands is a second
attempt to grab the bands.

Remember the 220 waste

After they got the spectrum they could not make use of it.

Although amateurs may not have the power to keep a commercial intrest
from stealing our spectrum, we make up a significant portion of the
decision makers, and prospective client base. UPS has not seen any
of my business since the 220 issue.

I would suggest that we as a group, can bring a lot of finacial pressure
to bear, with our pocket books and our recomendations. As we control
or influence to various extents, the purchasing decisions of the market
place and most potential target customers.

A listing of the Companies proposing the LEO allocations in our bands
should be posted and a followed with concerted effort by all amateurs
to boycott, or otherwise negativly impact these companies.

Source record: 200154

The compact ones are a compromise. Even my Heath SA-2060A didn't rate that well way back when they tested 'em. Of course, when you run just 5 watts through a tuner rated at 2000, you don't see many problems...

I have heard that Ten-Tec's auto-tuner (2 kW) can match anything from 2 to 1300 ohms, and pump through the rated 2 kW while doing so. Of course, it's almost a kilobuck...

I have the 738, I did not know they where using the uPC1241H for
the audio output. I know that chip. You don't need to cross it
just order it. You would not cross a 741c would you?
everyone in electronics knows an MC4066,uPC4066 and a CD4066 are
all the same thing.(cmos switch)
There are some part numbers that are just STANDARD and recognizable.

uPC12**H should tell any tech its an 12 volt audio chip. But the
H means high power I belive that chip will deliver up to 15 watts
if it is configured (floating ground) It should have the ability
to put out 6 or more watts as a common ground output if it
has a heatsink. I find it hard to belive it has gone bad in the
IC-738.

The uPC1241H should be available at most all parts houses
(excluding RAT SHACK) it is used in car stereos.
Try Consolidated Electronics or MCM

Alright let's get this straight once and for all!

There are FOUR ranges to Micor receivers and three for power amps and
exciters.

The way to tell the range of the receiver is by part number. I don't have
the manual in front of me, so by memory here goes:

TLD-8271 is L range 136-142
TLD-8272 is M range 142-150.8
TLD-8273 is H range 150.8-162
TLD-8274 is HH range 162-174

The front ends are identified by a part number of 01-80771B65 for
the M range, 01-80774B66 for the H range and 01-80771B67 for the HH
range. I don't know what the part number is for the L range.
I may be wrong on the exact part number but I am certain of the
65, 66 and 67 part. I could go out to the garage and look at one,
but it's after midnight already.

Exciters came in two ranges. 132 to 150.8 and 150.8 to 174 Mhz.

TLD-5131/TLD-8261 is the lower range
TLD-5132/TLD-8262 is the higher range.

The TLD-8261 and 8262 are the older models of the mobile exciter.

As for power amps...

The sixty watt model came in only two ranges.
TLD-1593 was the 150.8-162
TLD-1594 was the 162-174 range

110 watt models have three ranges.

TLD-1582 was 132-150.8
TLD-1583 was 150.8-162
TLD-1584 was 162-174

45 watt models were as follows

TLD-1602 132-150.8
TLD-1603 150.8-162
TLD-1604 162-174

Power control boards were also different

TLD-8290 45 and 60 watt
TLD-8380 90/110 watt
TLD-8620 45/60/90/110 watt units.

Also, the maximum draw at full power out is 24 amps as shown on page ii of the manual for a 110 watt radio. If this radio is pulling 35 amps, I would think something is really wrong. I suspect Karl is thinking of a Motrac or UHF Micor. They are much greater power pigs.

I will be glad to sell manuals to those interested also.

Unless the 5 year lithium cell went dead, you don't need to reset back
to the mod. Even if the lith is dead, you probably can just put in a
fresh pack, and the radio will reset.

If the above is wrong, yes, pushing the up and down arrow keys while
powering the 530 up will cause a reset.

I do not know of any currently Amateur radios that support two tone decoding.
You will most likely need to purchase a commerical radio like the ICOM F30 LT
for VHF or ICOM F40 LT for UHF, both support tone tone decode with the UT-80
installed

From: mzilmer@deltanet.com
Message-ID: <31b5297a.14822273@news.deltanet.com>
Source record: 200162

Hi,

Jeff and I did, in fact, suffer a few serious setbacks, including lost jobs. So Anacaonda has had to take a back seat while we got re-established. This did not happen right away for either of us. Peronally, I am just starting to recover.

This is not an excuse, nor an apology. We are holding inventory on the remote (radio) PCB's. The brain (control head) PCB is in layout now. Firmware needs the most work, and is in process. Manuals are also in process (assembly and installation manual is being proofed, operator manual is done).

No more promises, and no more magic dates. We both have a sizable investment so far and will finish the project. Then on to the Syntor X remote PCB and kit. But, sorry for the delay.

Please *do not* post replies or flames in this newsgroup. If you must post these, please send them instead to mzilmer@deltanet.com. I'll be fielding the queries from now on. If our potential users have any patience left, thanks.

KN5L Has a problem with his rig, or his ears.

I have the 738 and its better than the Kenwood 850 (personal opinion)
The only thing I don't like about it is the Local Osc drifts a little
it stays within specs 200hz but 200hz is alot in my book.

The rig is easy to use, you won't need your manual just hook it
up and run.

This is going to be a problem because it's not type-accepted for that. You could lose your ham license doing this (assuming the FCC actually cared :-)

THERE IS NO MOD FOR THE TS450 FOR EXTENDED RX ABOVE 30Mhz you will
have to add a transvertor (can be done with a few parts)

3584. FT102 Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-06 00:00:00 UTC
From: r.a.booth@shu.ac.uk
Message-ID: <4p6oq5$2m1@redwood.shu.ac.uk>
Source record: 199919

Hello Everyone

I'm having a problem with my FT102 transceiver. When I end transmitting
and release the PTT switch, the relays click over and it goes into receive - as
would be expected. The problem is that now the receiver is very deaf. If I then
press the ptt a couple of times, usually the receiver comes back up. Could this be
caused by faulty / dirty relays in the changeover circuit ? Is this a commom fault ?
Any suggestions regarding repair ?

Many Thanks

Richard Booth, G0TTL

Ron,

The "Times Microwave Coaxial Handbook" says:

RG-389
Inner Conductor: 0.2500 in. BC Al.
Dielectric: PE Spline
Nom. DOD: 0.635
Sheilding (number/type): 2/SC
Jacket material: PE-IIIA
Nom. OD: 0.875 in.
Weight: 0.366 lbs/Ft.
Nom. Impedance: 50.0 Ohms
Attenuation @ 400 Mhz: 1.5 dB/100Ft.
Nom. Capacitance: 22.8 pf/Ft.
Operating Temp. Range: -55 to +80 C.
Max. Operating Voltage: 2000

Notes: Low loss version of RG-189/U

Hope this helps a bit.

You'll also find that the GXII allows control of more functions. in
particular, you can't remote control the sideband selection on the
older GX. Real disadvantage for remote base use.

Uh, maybe I'm missing something. To "modify" a DSP filter would require modifying the code stored in ROM. The RatShack unit has this code stored on a soldered in DSP chip.

Unsolder the chip, and then (if it isn't read protected) load it onto your PC. Decompile the code and simply make the changes.

Good Luck!

: Does anyone know of any more information... the web sites mentioned
: below were not much help.

I guess you're talking about the Rohm Ba1404. It's a stereo multiplex generator plus an FM oscillator; you can build a stereo FM transmitter with just this one IC and some parts. But follow the Rohm spec sheet exactly unless you know what you're doing -- it's important to preserve the phase angles and duty cycles in the multiplex circuit. Even the designers of one popular FM stereo transmitter kit goofed up the design for their unit because they didn't know what they were doing. The one problem with this unit -- FM carrier instability and drift. It's really best to use the BA1404 to generate the subcarrier, pilot tone etc., and then use a separate FM transmitter (frequecy controlled) for the carrier.

Pete

From: geo@nando.net
Message-ID: <31b6bc0a.638228@news2.nando.net>
Source record: 200083

> If I DO get interference, would a DSP unit help?

The best offense is a good defense. Getting rid of the noise source is always more effective than using a DSP on the noise.

The problem with the DSPs is that they are working after your receiver, that means the AGC has already been affected and weak signals lost. If your line noise is stronger than the signal you want to hear, it can't be recovered (it can't put intelligibility where none exsists). If however the noise is weaker than the desired signal but is just unpleasant the DSP can provide some relief.

The only noise reduction mode effective on impulse type noise is Spectral Subtraction which JPS has in the NIR 12. JPS also sells the ANC-4 (for half the price) which is a real honest to goodness RF device intended to eliminate mna-made noise BEFORE the RX. Unfortunately it's upper limit is 80 MHz, so it will work on 6, but not 2 meters.

There is only one thing worse than the nazi's, communists and internment governments: A racist people with a supportive government that will lie to you one day then kill you and steal your land the next. Just ask any native north or south american, if you can find one.

I wonder what would have happened if the Souix nation had had nuclear weapons back in 1870?

>Bye,
> Tom (an ordinary German and as a ham - a citizen of the world).

While no rational person would blame younger Germans for the
holocaust, this comparison between the NAZI holocaust and Japanese
internment is a little absurd. While Japanese people were interred,
they were not enslaved. They were not processed in factories of
death. Their body parts were not used to make lampshades, knife
handles and soap. On the other hand, they were allowed to serve in
the military through which they were the most highly decorated group
in the war. Comparing this to the real holocaust is an insult to Jews
everywhere.

On the other hand, I think that the original spammer's castigation of
the German people, especially the current generation, was unwarranted.
Aside from the Nazi's I see many positives in German culture.

SRI if these questions have been posted recently. Am considering purchase of FT-900/CAT and wonder whether the Collins filter does much. It would seem that xtal passband filter design has been reasonably stable for at least a decade. Why has Yaesu felt the need to offer the Collins filter? Was the other ssb filter deficient somehow? Or is this just a costly marketing gimmick?

Since I will be using the rig primarily on cw, does anyone have any info on whether the semi-qsk implementation is a good one? Does it significantly truncate the first dot or dash as some rigs do?

Tnx in advance, 73 de NT3G

3613. FT-11R DC Power options

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-06 00:00:00 UTC
From: kleerdex@epix.net
Message-ID: <4p6oov$7oo@star.epix.net>
Source record: 200093

I'm thinking of adding an external DC power capability to the Yaesu FT-11 without having to resort to buying several custom and expensive devices from Yaesu. Looking at the schematic, it would seem an easy option to attach a standard DC socket to an empty battery case and include 2-3 diodes for polarity protection and to drop to 11vdc. Anybody done this or see a problem?

Also, anybody using AA nicads in the FBA-14 battery case? I realize the manual says not to, but best I can tell that is only to sell more custom batteries, not for any technical reason (OK, the store bought nicads don't have current limiting, but that isn't really a problem, is it? If the radio has an internal short it already has a problem and I don't plan on using the radio in explosive atmospheres anyway!). Any comments?

From: philkeys@olympus.net
Message-ID: <philkeys-0606960603040001@ptpm001.olympus.net>
Source record: 200095

What's a good rugged dual-band HT for use in wilderness search and rescue? Here are some conflicting requirements:

Rugged and reliable
Waterproof (water resistent?)
Full 5-watt output
External DC power input
Long battery life
AA cell battery pack accessory
Rugged speaker-mic
BNC antenna connector
Easy to use
Easy to use in the dark
Lightweight
Modifiable for public safety band transmit.

HT will be used in all weather condition in a chest pack while hiking and climbing. Will be carried in a chest pack, usually with flexible 18" antenna and backup external 12 VDC battery.

move, must get rid of the excess before I get new. Have the following
for sale:

Alinco DR-600T 144/440 mobile with remote cable $410 OBO

ICOM IC-720A HF Transceiver w/PS15 power supply
and service manual, really clean, less
than 2 years light usage. $700 OBO

Sony IPS-760 GPS w/marine map card,DC adapter $425 OBO
All radios have original manuals
All prices include shipping.

If interested return E-Mail with phone and I'll call you.

3619. Advice on 2m linear amps

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-06 00:00:00 UTC
From: tgeyer@rain.org
Message-ID: <4p72mf$3tg@news.rain.org>
Source record: 200099

I am interested in purchasing a 2m amplifier for my car. I hope to plug it into the cigarette lighter and boost my HT output. I have seen two inexpensive amps that seem to fit the bill:

1) Radio Shack. 120$ (100 on sale). Plugs into lighter and puts out 30W at 5W input.

2) Tucker electronics (99$). Don't know if it plugs into the lighter, but it puts out 20W on 0.5W input and 30W on 5W input.

Does anybody have experience with either of these two units? Any advice regarding these two units, or other similar inexpensive amps would be greatly appreciated.

Tom

Source record: 200103

There have been several in QST, unfortunately, I can't put my hands on the issues just at the moment. I suspect the one in the handbook is the one I built. It uses a MAX232 level converter with a buffer and a few caps and resistors. The MAX 232, probably the same as the other chip, is available fro Digi-Key for about $6 bucks, I think. I probably spent $20 putting one together, and it seems to function just fine.

There are a couple of other places for interfaces. A place called JBI Technology in O'fallon, IL, just a few miles from here, sells a kit for $30. There have been new product announcements in several of the ham mags, QST and Nuts and Volts, I know. Again, I don't have the address and number at hand, if you need it let me, I'll dig it up.

3625. Re: OWNER WO's on IC706, FT900CAT, etc.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-06 00:00:00 UTC
From: "William O. Reichert" <billnihh@apci.net>
Message-ID: <4p7kjj$g1n@queeg.apci.net>
Source record: 200105

I wouldn't say I've gotten burned on the IC-706, in fact I like it quite alot. I've been able to put it on the bench and run more checks than most hams probably can, and basically, it seems to do a fairly good job.

Until you get used to the menuing system, it can be pain. In fact, even when you get used to it, it can be a pain. Depending on what you want to accomplish, you can be five or six button pushes away from doing what you want.

Even with ICOM's FL101 250 hz cw filter, selectivity seems broad. I expected this, since for their bigger rigs, ICOM recommends using the 455 kHz filters for critical applications. Still, I've used 9MHz filters that are better. Maybe it is only a four or six pole filter. Have been meaning to see if someone like International Radio has a better replacement. If you don't work cw this is not a problem.

Mine gets pretty hot on ssb with anything approaching moderate operation; on RTTY or FM I imagine would be worse. Don't know if this is a problem or not.

Noise blanker is pretty bad. In my car, I don't have too much trouble with ignition noise except on 50 MHz. There, the NB will take an S7 level down to S2 or 3 at best.

The front end attenuator seems to be alot more than 20 db; in fact, on the local repeater I use most often, from the driveway it pushes the S-meter all the way up with the preamp on or off. Engaging the attenuator reduces the S-meter to about 10 over 9. Don't know if is the attenuator, or more likely, the meter.

Having to get into a menu to change mic gain, cw keying speed, etc. take some getting used to.

On HF, I show about 115 watts output on every band (Bird wattmeter with 250 w slug). On six, the best it will do is about 95 on a 100 w slug. This is even after punching things up a bit on the power set control (internal pot).

ICOM does not supply a schematic or even a block diagram. This is a disgrace. I tried to order a service manual for an extra $35, but they are on back order for up to six weeks or more.

Sensitivity above 60 MHz, except for the two meter band ranges from poor to just plain bad. I can't hear the local wx svc station on 162.55 at all; it is full quieting on a Radio Shack wx

cube that is fifteen years old. It does hear some in the aircraft band and it does hear some FM broadcasts, but it is full of intermod on the FM broadcast band. All this means little if all you are interested in is the ham bands. If you were going to replace a scanner with the 706, forget it. There are some mods out for the 706 here and there, don't know if this will help the situation or not, have not tried 'em yet.

Have not tried the other rigs, so don't know. I think the 706 packs a lot of punch for the money. It is not an IC-775 or FT1000, but for a low to middle end radio, I think it does pretty well.

>>I'm looking for a FIRST radio...

Unless you find out what is happening in your community, no one here can give you any good advice!!!

Join your local Amateur club! Find out what is happening (what bands are being used!!!).

Here's a generic "Welcome to the hobby!" text - and best of luck to you on that exam!

What is Ham Radio, and
How do I get started?

A short introduction
by Hans Brakob, K0HB

Here on HamNet we frequently see messages asking for more information about the hobby, and how to get started. This file is a VERY brief attempt to explain the hobby and give some pointers on where to get more information. Almost certainly I won't answer all your questions, so feel free to ask for help on the forum. Hams are famous for their eagerness to help newcomers.

(First I have to explain something you might not have realized. In doing so, I'm going to paraphrase something written by Steve Ford, WB8IMY, in his introduction to a book entitled "The ARRL Operating Manual". Steve, by the way is a regular here on Hamnet. He acts as the ARRL HQ representative.)

In case you didn't know, belief in magic is a necessary requirement for all Amateur Radio operators. Of course, you won't see a question concerning magic or metaphysics on the test you take to obtain your license, but in your heart you will come to believe in that powerful, intangible force.

All of us in the hobby have felt its influence at one time or another. Some night when the band is dead as a doornail you'll be tuning aimlessly, not expecting to hear a single signal because NOTHING could be coming through at that hour. But then, rising out of the noise like a ghost, there will be a faint call from another stalwart explorer thousands of miles distant. You pounce, establish contact and both of you marvel at the fact that the conversation is taking place at all. A few minutes later, however, the signal vanishes as quickly as it came. Your rational mind will shrug it off

as a quirk of propagation, but that little tingle in your gut will tell you otherwise.

If you could travel back in time to, say, 1294 AD, you'd probably be burned at the nearest stake for even suggesting that two human beings could communicate with each other over great distances without a physical connection. No doubt they would accuse you of dabbling in magic -- and they'd be right!

As Amateur Radio operators, we work feats of magic every day. Many of us have become jaded about our powers and we tend to dismiss them as commonplace. We hardly think twice when we use our equipment to sommon the elemental forces of the universe. But every so often we need to pause and remind ourselves of what we are really doing. We need to remember the essence of what drew us to our unusual avocation in the first place: the wonderful magic of wireless communications.

So how can YOU become a magician?

First, you need to prepare to obtain a Magicians License. The Federal Communications Commission calls them Amateur Radio Operator Licenses, and they come in 5 "classes".

There are two "entry class" licenses, namely the Novice and Technician class. These two classes of license are designed to give the newcomer access to a number of frequency bands without a too-strenuous examination.

The Novice class gives the widest range of frequencies, and will be attractive to folks with a desire to talk to "distant" places. The written test is the simplest of all the tests, and the examination also requires you to be able to copy Morse code at 5 words per minute. This license will also give you access to some "local" bands, but not as many as the Technician class.

The Technician class license, as the name implies, is aimed more at folks with a technical bent (you don't have to be an electrical engineer though). The written test is a bit more difficult, but you don't need to know Morse code for this license. The frequency bands for this license give you more "local" communications, although if you wish, you CAN take the Morse test, in which case you will also get

Source record: 200110

(Continued from previous message)

access to the "worldwide" bands the same as the Novice class.

The next three classes of license are General, Advanced, and Extra. These three classes have access to portions of all amateur bands, with progressively more difficult exams, and requirements for copying faster Morse code (13, 13, and 20 words per minute respectively).

To prepare for the exams you will need some study material and more information about classes, examination points (the exams are given by volunteer Hams in your community), and clubs in your area. A number of organizations will be more than willing to help. One such organization is the American Radio Relay League. Write them at:

ARRL
225 Main Street
Newington, CT 06111

or call them at 1-800-32NEWHAM.

Ask for their "newcomers" package. It will include more detailed information, a list of classes and clubs in your area, and a list of scheduled examinations in your area also.

If you are near a Radio Shack store, go there and ask for a book entitled "Now You're Talking". This book is also available from the ARRL. It contains all the information you need, including study material and sample questions for the examinations for Novice and Technician licenses.

Good luck, and welcome to the "magical" hobby.

AmSoft announces the June 1996 release of its CD-ROM "The World of Ham Radio". This CD-ROM contains the World's largest collection of amateur radio, electronic, and engineering software, plus the most recent FCC amateur radio license database available on CD-ROM. The current FCC database includes calls issued up to 22 April 1996. This software collection is the best available anywhere in the World for electronics, engineering, and the hobby of Amateur Radio. Over 20,000 files and programs for the hobbyist or professional. Stop by our WWW SITE: http://hamster.ivey.uwo.ca:80/~amsoft/ and see.

At $19.00 plus $4.00 Shipping anywhere in the World AmSoft has the lowest price for any CD-ROM offering these services.

There is an excellent contruction article with schematics in the 1995
and 1996 editions of the ARRL Handbook for Radio Amateurs. The article
was originally published in QST magazine of Feb. 1993.

For more information on interface possibilities, plus a look at THE
control software for Kenwood rigs, check the Kentrol web site at the URL
below.

Hey, the CNW 419 goes for about $300.00 new, and it is still a current model. I realize that they are hard to sell because most hams don't appreciate the quality and aren't looking for deals but "steals". I already have one and don't need another but...wow if I did need one I'd buy yours in a flat second. Incidentally, you can convert your unit to PEP reading, by getting that neat little module advertised in QST for 19.95. 73, Fred AB6GQ

3635. What's better Icom IC-728 or IC-706 ?

> Good luck finding a type-accepted public-safety-band radio with the ham bands
> on it too.
>

In my experience the vast majority of VHF hi-band commercial/public service radios (SAR groups are in the Special Emergency Service, and get frequencies around 151 MHz typically) can handle 2-meter ham frequencies just fine. I have two Motorolas, for example, and use both for SAR and ham work. Nevertheless, the rest of Jerry's post is right in that you really should get an FCC type-accepted radio and program some of its channels in the ham bands rather than the other way around. My favorite at the moment is the Motorola JT-1000, but it's rather expensive. Any Moto is good; GE is another really good brand. Standard is a less expensive brand that also is pretty good in my experience. IMO stay away from Midland, Rolm and Bearcat. All major manufacturers of commercial/public service radios sell dual-band VHF-Hi/UHF radios, which can be used as 2m/70cm ham HTs; they're rather rare since few have need for such radios in the commercial world.

Of course, those of us, like myself, whose SAR work is done under Federal jurisdiction, are operating NTIA-licensed stations when so doing, not under FCC jurisdiction. For this reason, there is no FCC type-acceptance required for us; that's why you see radios advertised as "MARS/CAP modifiable." Unfortunately, non-Federal users of the radio spectrum, such as your organization, must have FCC licenses and therefore should obey FCC regs.

>
> Tnx in advance, 73 de NT3G

Charles; you are right. Crystal filters have improved to the point that
they are as good and inexpensive as a mechanical filter. The only
difference is the sound. A mechanical filter has a different sound
to it. If you have ever listned to a properly performing KWM-2, you
would understand. It's nice to listen to a new HF radio that sounds
like a KWM-2. It's been a long time. Not everyone wants this type
of sound. Some prefer the pitch of a cystal filter. Suggest listening
before making your choice.
I have the 500Hz CW filter in my '900. No problems noted on CW here.
Good Luck. Dave. WA0ZZG.

> Richard Booth, G0TTL
> email :- R.A.Booth@shu.ac.uk

Richard, This is a very common problem with the FT-102. The small relays were notorious for causing problems. While the "ptt" trick works for a while, the relay contacts will eventually fail entirely and your rig will remain "deaf".

The repair reqires changing several (over 10) internal relays. I understand a gentleman in the USA specializes in FT-102 repairs, (advertized in the classified section of QST MAGAZINE). However, since you are in G-land, I suggest you contact a reputable service tech / center (possibly Yaesu Europe).

I once had an FT-102. The relay repair for mine was almost $US 200.

I need to build a circuit that will do the following:

Take a normal 2 wire tel line and convert it into transmit audio, receive audio (basic 2 to 4 wire conversion), detect ring, and control on and off hook.

Basically I am looking for a telephone interface to be used with a repeater controller.

I would like to use a cct with as few components as possible, ie. the hybrid cct. contained in an IC.

Manufacturers of such IC's and part numbers would be great.

Any help would be appreciated.

Since you have specified a Ham HT, I will assume you will be using it on ham frequencies. In my not so humble opinion, the best radio for this purpose is a used ICOM IC-32AT. It is neither micro-small nor featherweight, but it is a rugged good performing radio with some of the best audio you will ever find. I have two of them I use for wild'n'wooly projects and they have proven to be good, bullet-proof radios.

They usually show up used for around $300-350.

Good luck in your search.

OK, I've heard enough positive reviews on all these "mini"-rigs, so now I'd like to \hear the bad news.
\>How about some of you guys that have been "burned", on these rigs (new buyers only, \not used).
\>I want to hear about the bad points, or "horror" stories, on any of the new \"mini-rigs".

The 706's supplied HM103 stock mike has notoriously low audio on 2M FM... The 706 will not scan the way most VHF rigs scan. It can scan, stop on an active channel, & stay on that channel. Or, it can scan, stop on an active (memory) channel for 10 seconds, then go on... It CANNOT scan, stop on an active channel & stay there till activity ceases, then move on... 2M at 10 watts in NOT enough. I use a 2M allmode 100w amp & that solves that problem. Entering memory names for memory channels is not at intuitive as with, say , a scanner like the AR8000 by AOR. Too bad the audio mutes while doing a spectrum sweep! I still love that feature, though. Too bad the 706 won't cross band repeat or AT LEAST dual receive on any two bands (2m/6m, 6m/6m, 2m/2m, hf/2m,6m/hf,hf/hf). Wish CTCSS decode was an available option. Doing the "yellow wire mod" is a must, because out of the box, the 706 is not very sensitive above 60MHz (excluding 2m). NEVERTHELESS, I LOVE the rig. Just a few gripes to an otherwise
unbeatable value!!!!!!!!!! Everything else, quite a bit, I love!!!!!! Just my 2 cents.

>I am interested in purchasing a 2m amplifier for my car. I hope to plug
>it into the cigarette lighter and boost my HT output.

Tom,
Going to all that work and expense is fine, but don't ruin it by
plugging it into the cigarette lighter. It isn't designed to give
you the full battery voltage under the load of 30 watts output power.
Please spend the extra time and trouble installing fused wires (yes,
both the positive and negative leads) right to the battery. This
also reduces the chance of picking up alternater and other sources
of noise.

Good luck,
Brian N6ZAU

BSD Not LINUX ?

The HM-23 Mic fits the IC-27, 37 and 47 radios. It is the same as the HM-14
except for the mic connector. The pinout should be as follows.

Pin 1 Mic audio
Pin 2 + 8 volts
Pin 3 freq Up / Down
Pin 4 No connection
Pin 5 PTT
Pin 6 Chassis Ground
Pin 7 Mic ground
Pin 8 No Connection.

A used KW Match Box will do much better than that. In addition, you won't have to worry about balun losses and imbalance when feeding reactive loads. Incidentally, the KW rating was factored on the basis of an AM transmitter running 1 KW plate input. That equates to about 3,000 watts peak power handling capability, even neglecting Johnson's ultra-conservative components. I've been told it will handle more than 6 KW into a 50 ohm load.

What? You want to use a non-type-accepted radio in a service which requires
type-acceptance? But that's illegal!

Good luck finding a type-accepted public-safety-band radio with the ham bands
on it too.

I regularly run 1500 watts of continuous carrier (RTTY) into one of these tuners, feeding a balanced load, and have had no problems with arcing or heating. If it uses the same component(s) as the problematic MFJ, I'm not sure how one would explain this. Better mechanical design maybe?

>Rolfe
>W3VH

Hi Rolfe,
I would expect better tuning or a higher Z load exists at your station. Or perhaps you know how to tune a tuner correctly.

All T networks handle the least power into capacitive and low impedance loads, the poorest bands are the lowest frequency bands. T networks actually handle more power into high impedance loads than they can into 50 ohm or lower impedance loads.

MFJ gives rather poor instructions on tuning, and if the manual is followed you'll likely wind up with much less power handling than is actually possible with the components used in the tuner. The weak point in for RTTY operation both the Vectronics and MFJ tuners is the Oren Elliot Products roller inductor, which has a Q of around 65 on 5 MHz, rather pathetic. The capacitors in the Vectronics are smaller, which lowers the PEP voice rating...but certainly not the RTTY rating.

Most tuners use the OEP roller, although MFJ is switching to a custom air wound roller sometime soon I believe. Even the ceramic Cardwell roller used in a 1000 dollar tuner is only a little better in Q. A good coil should be in the 150 to 250 Q range when mounted in the cabinet, I've acheived that value here with simple home made rollers...so I'm sure factories could do that.

In any event, capacitors should always be set for the maximum capacitance possible that allows matching the load. That insures the lowest possible Q and minimum losses, voltage, and heat in the tuner. Complaints usually come from people with short antennas resonant above the operating frequency, and most problems occur on 160 and 80, or from people that don't understand how to adjust the tuner and blindly follow poorly written tuner manuals.

L networks (falsely called Pi's by some manufacturers) handle much more power, but have a much more restricted matching range. There's just no free lunch in tuners.

From: w8jitom@aol.com
Message-ID: <4p9dhf$37j@newsbf02.news.aol.com>
Source record: 199950

My biggest beef with my IC-706 is the weight control is not a weight control at all, it is a useless ratio control.

Secondly, the QSK sucks. While it does work, it shortens the characters by a few mS
That has the effect of making the CW choppy, like it needs more weight. The effect is worse at higher speeds.

Now here is the irony, if the weight control in the 706 was "really" a weight control, the user could use it to "fix" the QSK error.

I think the person that did the softare had no clue what CW really is.

The most disturbing part is ICOM cares less, they don't even answer letters about the problem. That's changed my attitude about their equipment more than the problems have.

Hello, and thanks for taking the time to read this.

I've been looking around for a dual band mobile for a while now, and have
been intrigued by the FT-8500 that came out a while ago. I've searched
through QST for review articles, but found *none*. The criteria that are
important to me include:

1) Ruggedness - yes, this unit will probably be mounted in a truck
2) RF/IF and Intermod rejection - clean on both Rx and Tx
3) Alphanumeric entry - (seems good on this one)

If you own one, or have some experience with the unit, I'd be glad to hear
your thoughts. Please e-mail me direct to save space in this newsgroup.
If I get a good response, I will repost the replies to the group as one
message.

Thanks again for your time.

^^^^^^^^^^^^^^^^^^^^^^^^

It also produces very 'thin' audio, which lacks any bass response. Is
it purely a function of the supplied mic (in which case the problem is
quite easy to fix, but shouldn't need fixing!), or is the problem an
inherent design fault in the rig itself?

>Radio Shack has one for about $35. Works for me.

I've always wanted to say this --

"ME TO"

The Radio Shack is a nice, compact inline unit, fairly ruggedly built.
I'm happy with mine, though I use it primarily for a go/no-go tester
(which is all that most sub-$300 meters really are, anyway). Accuracy
is suspect on a $35 meter, but it reads relative power just fine.

If you REALLY want to know what your radio's doing, you may want
a Bird 43 with the appropriate slugs -- ideally a pair of 43s
back-to-back, or a two-slug Bird line section with meters.
This is a Cadillac set-up for amateurs, but may be overkill for some.

3678. YAESU FT-890 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-07 00:00:00 UTC
From: PWOLF <pwolf@tiac.net>
Message-ID: <31B8883D.6549@tiac.net>
Source record: 199958

Greetings,

I have just purchased as my first HF rig, an 890. It has the built in antenna tuner. I am able to work all bands with the exception of 10 Mtrs FM.

I have a G5RV that is temporarily set at about 10-15 feet off of the ground, with most of the ladder line actually laying on the ground. I do have it stretched out so it is not coiled or doubled up. This is a temporary measure until I can get a cherry picker in to remove several branches so I can rais it up to about 40 -50 ft. I should be able to get this done in a week or so.

There is a 10 mtr repeater in Boston, about 35 miles as the crow flies. I have noticed that when I tune my antenna in the 10 mtr band, the unit takes several seconds (20-30), as opposed to say the 20 mtr band shich is 1 or 2 secs. I have the correct frequency, offset and PL.

When I attempt to xmit to the repeater, the meter registers full output power. But I can not hear the repeater, nor can I get to it. Just after I release the PTT button, the "hi swr" indicator comes on for about 15 seconds.

Where this radio was used, I have only another week or so to return it if it is defective.

Could this be related to the poor positioning of the antenna, or does it sound like something may be wrong with the radio. As you can see from my call I am new to the HF world. Any information would be appreciated.

Thanks

73

To say that what was done to our citizens of Japanese ancestry
in WW II was wrong is a reasonable statement. I agree that it
was wrong and should not have happened.

It is also valuable to find a way to understand what made it
happen. Was it a result of malice or ignorance or just fear?
It came from all of those things, of course.

Could it have been avoided? Probably so. Facing the same kind
of situation today, would we act differently? I certainly hope
so. You and I are the only ones who can change the future, and
we must do so.

As for the past -- Since we cannot change it, we make what
reparation we can to those Americans we treated so terribly
because of their ancestry and culture.

We need not pretend that no mistake was made.

Yaesu FT-530 Handheld Dual Band Amateur Radio $200

comes with remote control speaker mic
2.5 watt and 5 watt battery
two carrying cases
miracle baby antenna
car adapter
car mounting equipment

The radio is in excellent condition, has only been used for about 3 months, and works great.

Shipping is free.
Will accept pre-paid by check or money-order or will ship COD for $5 more.

Of all places, Radio Shack has one they can order and have in stock or delivered to youfor about $70 (I think)
Works well and is designed for both those bands (thats the only Ham bands they sell) I bought one a couple of years ago and have found it very reliable.

Message-ID: <SteveP-0706962059280001@ka2-45.dartmouth.edu>
Source record: 199872

Hi,

I'm a current owner of an Original TAPR TNC-2 Clone with a VERY old ROM, roughly 5+ years old. Have been considering upgrading for a while. Everywhere I look on Packet around here I see folks running these two units, plus the PK88.

I am looking for any opinions on either of these models. I don't really need 9600 yet, and am looking for a solid TNC, with the usual bells & whistles. Have considered doing APRS, but have an old non-NMEA compatible GPS, so that may have to wait.

I've narrowed it down to the KPC-3 and PK-12 - any pluses/minuses? (I've heard that AEA has poor service.)

Thanks for any thoughts you might have. E-Mail to the below address.

Close, but not quite. The ANC-4 is an RF product. This means the noise is removed BEFORE the receiver. What difference does that make? No DSP or other audio filter can let you here a S3 signal in the presence of S9 noise. The weak one is gone for good! But, if you remove the noise before the receiver, you can hear the weak one.

The ANC-4 works by using a noise sense antenna that is a good local antenna, but a poor DX antenna. When this antennas signal is equal in amplitude and 180 degrees out of phase with the main antennas signal, the noise will cancel and the desired signal will remain.

For more information about this see 1. the JPS web page, 2. E-mail JPS at jps@nando.net or 3. see Doug Demaws QRN Squasher article in this months CQ magazine.

JPS makes a box that simply adds local noise (like power line noise) 180 degrees out of phase to the regular receive audio. The result is audio which has the noise "subtracted" from the received signal.

Maybe someone on the net can comment on how the box (model ANC-4 ?) works with nearby power line noise, as well as other local noise sources.

Mat

3688. Trade DSP-93 for DSP2232 or 1232

>Please give me your recommendations on the FT-50R. I am new to ham
>radio and want to get a HT that has lots of features and a good
>value.
>
>Can anyone tell me about the SMA antenna connector? Is this standard
>like the BNC connector? How hard is it to find adaptors for BNC to
>SMA?

SMA is a standard connector used primarily in commercial microwave
equipment and other critical applications where constant impedance
and small size are important. Like the BNC, the female center pin
is fragile. Neither are intended for frequent connection and
disconnection. They should be treated as assembly connectors. The
SMA, due to its smaller size, should be so treated even more so
than the BNC. There are SMA->BNC adapters available, even Radio
Shack carries one.

Caution: These adapters can put undue strain on the FT-50R antenna mount.
The standard antenna has a shoulder which contacts the case and relieves
sideways strain on the SMA connector. The adapter does not have this
mechanical feature. Use the adapter only in cases where the radio and
cable will not be under mechanical stress.

>Why is it so cheap ($340) compared to similarly equiped transceivers
>lie the FT-51R($520)?

It only has one receiver. The FT-51R has dual receivers. The FT-51R
can do dual simultaneous receive, the FT-50R cannot.

>would a DSP unit help?

Probably not. The current crop of DSP units don't seem to do much
for impulse noise, and of course they don't prevent the effect such
noise has on receiver AGC since they operate at the wrong end of the
receiver to do that.

The best cure for power line noise is to cure it at the source. The
cause is usually loose hardware on the pole, or a cracked insulator.
Test for noise with a receiver (a battery powered AM receiver will
do), and work with your power company to solve it.

But if you look at the CQ article, remember it won't work as drawn. The phasing circuit is technically incorrect and non-functional.

The description of the theory in the article is correct.

3701. The German (ham) pyche

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-08 00:00:00 UTC
From: Burt Fisher <k1oik@ccsnet.com>
Message-ID: <31B99657.7501@ccsnet.com>
Source record: 199890
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur,policy,rec.radio.amateur.packet,rec.radio.amateur.equipment

The best selling book, "Hitler's Willing Executioners" by Daniel Jonah Goldhagen tells the story of how ordinary Germans (like hams) allowed the holocaust to take place. The author shows the ingrained deep hatred for Jews that Germans had for Jews before Hitler came to power and that there was a widely held shared view that the the Jews ought to be eliminated in some way from German society. When Hitler, ultimately, chose mass extermination as the only "final solution" he was thus easily able to enlist vast numbers of Germans to carry it out.

Of course those Germans NOT alive during World War II cannot be held responsible. But I refuse to respond to German "CQs" because I feel the mindset of Germans even today would allow a repeat of the holocaust if the only could find another Hitler. This was shown during the recent Gulf war when Germany was the one selling weapons and materials to make poison gas to Iraq.

Surely there are some caring decent German people that would resist another Hitler and another holocaust but there are too many Germans just waiting to finish what Hitler started.

Is there anyone that agrees AND is willing to say so?
I notice that hams rarely will stand up for or stand against anything.

I've still got one of those from many years ago...
It uses an MRF 247 transistor which gives 90W output, but due to the
poor bias circuit I would be inclined to keep it down to around 50W on
SSB. Drive power should be 10Watts max.

The Preamp uses a 3N204 which may be a bit long in the tooth these
days...

I built a new bias circuit for mine and ripped out the preamp...

Good luck !

Try Oak.Oakland.edu its got it all!

You can anonymous FTP (use "Guest" as your password, no quotes) to
that location. the sub directory you want is:

/pub/hamradio/mods

From there go to the subdirectory of the maker of your rig.

73,

Phil N1XLP...

I picked up an Collins automatic, microprocessor-controlled antenna tuner-
CU-2275(V)2/ARC-190 - and I'm a-lookin' for enough info on it to allow me
to hook it up and make it play. All I know about the ARC-190 is that it's
a 2-30 MHz SSB 400-watt rig. Have source of 80/40m RF, enough wire to
make a rudimentary endfed longwire antenna, the mating connector and
plenty of 400Hz power- all I need is the info!

>
> =Vic=
> WA4THR

I have got the FT-41R, which needs the same psu as the FT-11R. I
actually have bought the PA-10 for mains use. It cost 60 pounds. Anyway
one day I thought I'd have a look inside and see what my 60 quid had got
me.......NOT MUCH. There is one transistor from what I recall, and a few
resistors.

The PA-10 can take up to 16volts from the car battery, and the PA-10
needs to regulate it down to 9.6 volts? A series shunt regulator with a
zener diode would probably do the trick. Or, you could connect the car
battery or psu, etc directly to the little metal tags at the back of the
radio and supply power in that way. I am not sure if the 41R can take a
12 volts input directly. Put in an electronic fuse to be safe. The sight
of a 300 pound radio short circuiting across a car battery could be
upsetting!

Germany's actions re: the murder of 10 million people, was inexcusable, and unspeakably evil. However, I call to your attention the fact that Germany has admitted its guilt, and has tried to attone for it. This is more than many other countries, which also engaged in deplorable behavior, have done. No point in naming them, or getting into a debate about the relative evils of their actions.

Amateur radio is an international fraternity that should transcend individual politics and ideology. You can't promote brotherhood and understanding if you simply refuse to talk to people.

Your decision though.

From: blackie@gate.net
Message-ID: <31bb070a.10340894@news.gate.net>
Source record: 199820

I have an old Yaesu FT-227R 2 meter rig which quit working a couple of years ago. The problem is that when you transmit, the led display goes blank, and nothing happens. One thing that I did notice before it quit transmitting all together is that the power output was slowly diminishing. Seems like it put out very little power even in the high power mode (10W).

My question is this rig worth fixing? I have thought about sending it to Yaesu to get fixed, but I really don't want to spend more than $100 to get the job done. If it is more than that I may just get a new second hand rig from someone.

Has anybody out there experienced this, and is it a problem that is fairly inexpensive to fix?

>>sure
>>how one would explain this. Better mechanical design maybe?

>I would expect better tuning or a higher Z load exists at your station. Or
>perhaps you know how to tune a tuner correctly.

Well, I think I know how to tune a tuner (using highest capacity
setting that will achieve a match), but it may be that I also have
a higher Z load than others are trying to match. I use this tuner
to match a 160 meter double-extended Zepp, which I also use under
certain conditions on 80 and 40. It has gotten most of its use
on 80, in fact.

Do you have any experience with the Collins 180S-1 tuner, which also
is fairly compact physically? It may be operated as either an L or T,
although it has no internal balun so if you're feeding balanced line,
you need to provide a balun someplace. I don't believe these were ever
claimed by Collins to be rated at legal limit power, even under the
old rules, but plenty of anecdotal evidence suggests that they handle
the current legal limit just fine. Again, this may not be true for
extreme mismatches or Z loads that create lots of voltage. (For those
who are following the discussion, this tuner was not an amateur
product, but was designed to feed a wire trailing from an aircraft.)

I'm looking for an ultra low-noise wideband preamplifier to
replace a Plessey ZN460 in an old instrument.

The existing pre-amp has the following data
50-60 db programmable gain,
6 MHz bandwidth (3 db down, without external components)
800 pV/Hz noise figure, or 40 Ohm equivalent noise resistance
supply current: < 3 mA from 5V

Does anybody know any pre-amp with similar performance figures?

I understand that Plessey will stop producing the ZN460 soon.
Do you know whether they have any replacement or anything similar
which could be used, perhaps with some redesign of the rest of
the circuit?

Could you suggest Semiconductor manufacturers who produce
RF pre-amps in that range?

Please reply by direct e-mail.
Thanks in advance.

3734. Yaesu FT-2500M memory cloning cable

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-09 00:00:00 UTC
From: Bill Young <byoung@qni.com>
Message-ID: <01bb55ff.59de8f80$28721dce@noteswrk1.BANCSHARE.BOATMENS.COM>
Source record: 199826

A cable (Yaesu part #T9101418) can be used to link two FT-2500M radios and
"clone" the memory of one to the other. Does anybody out there have the
pinout of the cable? Two reasons I'd like to make my own: the cable's
not in stock at my dealer, and the cost! Thanks for any help.

3735. XTAL vs MECHANICAL filters

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-09 00:00:00 UTC
From: kk5dr@io.com
Message-ID: <4peqrf$jr9@anarchy.io.com>
Source record: 199827

I have seen alot of questions about the differacne between these filters, I will attempt to give abit of info on
both.
XTAL filters are easy to design & manufacture, but have their limitations, such as; poles vs ringing effect,
passband width vs ripple effect.
To get a better shape factor to the filter passband, one can simply add more poles, but a "ringing" effect
becomes evident at more than 4 poles.
To get less ringing, you can widen the passband , but a "ripple" effect then appears.

MECHANICAL filters, are more difficult to design & manufacture, but are nearly free of these "ringing" &
"ripple" effects.
Out of passband attenuation is much greater in these filters, and IMD levels are much lower too.
Older hams know what I'm talking about here, more than the younger ones do.

Late model YAESU rigs are now using "old mechnical" filters for the above reasons, it just makes a good
transciever, even better.

My source for this data, is THE RADIO HANDBOOK by Bill Orr

By any chance are these two radios the same? They look similar and the only difference that I can see is that the Uniden model has 500 channels vs. the RS unit which has 200. If they are the same is there a mod to get the extra 300 channels?

I Have an Alinco DJ-F1T that is going for $260 with the high capacity
battery pack (5W). 2M with extended mods available at the snip of
a wire. It has been very reliable and the Wattage is 100mW/1W/2.5W for
the normal battery. 100mW/1W/5W with the high capacity pack. 40 channel
memory and DTMF paging. The best part is the Extended recieve and its
pocket size. $20 buys the 'AA' battery papck for those cases where
recharging is not available.

3745. TRADE ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-09 00:00:00 UTC
From: mark russo <mrusso@hoflink.com>
Message-ID: <31BB4076.342F@hoflink.com>
Source record: 199837

Would anyone out there consider a trade ? I have a Kenwood TR-7930 2 meter mobile in 99% mint shape. It has 21 memories, factory PL, 25 watts, touch tone keypad on the front panel, nice green LCD display, center tuning LED, reverse and priority LED's, time and carrier scan, mic, mobile mounting bracket and the manual. This radio has NEVER been mobile. It was mounted under a shelf in my shack. I was going to post it for around $200 dollars. ALSO, I have a Santec 2 meter HT. This radio has 4 watts output, 10 memories, LCD display, PL, touch tone keypad, rubber duck antenna, charger and the manual. It is not in mint shape but works great. This is worth around $125 dollars plus.

I would like to trade both for a
Radio Shack Pro-2006 scanner or
Yaesu FT-530 handi talkie or
Alinco DJ-582 handi talkie or
an older 2 meter all mode (digital)
These items should be in good working order and should look good.

What do you think?
Thanks, Mark

>

John;

FACTS:

QRZ added 32 New Programs in the June 1996 Issue
AmSoft added 108 New Programs in the June 1996 Issue

QRZ June 1996 has a corrupted file "tfhpn101.zip"
AmSoft tests all its files.

QRZ June 1996 has published damaged data in the call sign data
Check out KC8CSF, KC8CYB,KF4GSM, & N3XGK on your QRZ!
These people were all born on 12/31/99? and got a ticket on 12/31/99??
AmSoft notified the FCC of these flaws on April 22. The FCC fixed them.
It may be a surprise to you, but SAM, BUCKMASTER, & AMSOFT all fixed
the call sign errors before publication this spring , QRZ did not....

So go ahead an spend your $12.95 or the $9.40 they were selling for at Dayton!
You only get what you pay for.....

BTW I also use the flying horse CD and like it.

Pete, KC3TL

Acknowledging guilt is grossly inadequate to reconcile what
the Nazi party did in terms of the country's ongoing liability.
Germany is still governed by socialists and despite the horror
of their history, they have not formed a constitution capable of
preventing such atrocities in the future. For the present
government to merely understand and admit that the genocide
committed by the Nazis was wrong will be of little comfort to
any future victims.

>This is more than many other countries, which also engaged in
>deplorable behavior, have done. No point in naming them, or
>getting into a debate about the relative evils of their actions.

In every instance, such atrocities have begun with government
refusing to recognize "lesser" individual rights, as well as its
responsibility to protect them. The lesson that should have been
learned in Germany is that government must be constitutionally
prohibited from using its power for any purpose other than the
protection of individual rights. That is its *only* moral
purpose, and every government in existence, including the U.S.,
remains in violation of this principle. For all nations not
to have corrected this in the aftermath of such horrendous
human suffering is a crime in itself.

>Amateur radio is an international fraternity that should
>transcend individual politics and ideology.

How does one transcend genocide? Individual politics and
ideology are the determinants of one's morality. Isolating
Amateur Radio from this arena only serves to expand its
presence into countries where the technical training to
which we are a party becomes a tool for government
oppression. No fraternity can possibly be claimed to exist
under such conditions.

Not (exactly) true. The current constitution, written with the guidance of the allies, prohibits any German military action outside germany. This provision was written in to prevent Germany from ever again engaging in offensive warfare and conquest. However, you do have somewhat of a point, Jack. The current constitution is weak in the most critical area - preventing hate crimes. Yes, Germany is governed by Socialists. Lets not forget one thing: Hitler was a facist.

> For the present government to merely understand and admit that the genocide

3750. FT-50R Voice Messaging Question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-09 00:00:00 UTC
From: dddavis@atl.mindspring.com
Message-ID: <4pfcfg$1v6s@mule1.mindspring.com>
Source record: 199842

I just purchased the optional keypad to allow voice messaging. Following the instructions very exactly, I do get the radio to accept my page and record a voice message. It then plays back the CW ID over the air, followed by the message just recorded. It does not play back the message in memory 2. I have split the voice memory into two parts and have verified the response message is properly recorded in partition 2. I can play it back manually, and I can also play back the paging message recorded over the air. anyone else have experience with this?

By the way, this radio has been "modified" for full receive coverage. Perhaps there is an unintended side effect.

Any responses welcome.

Thanks, Don (KE4KYO)

3751. Help-ICOM Z1A

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-09 00:00:00 UTC
From: "Kenneth I. Rotker" <kir@pacbell.net>
Message-ID: <31BB41D7.52F8@pacbell.net>
Source record: 199843

I just bought a new Z1A & I ran into a programming anomaly that has me baffled. When I'm programming a repeater into memory or just using the VFO and I turn on the tone encoder by pushing FUNC & then T/TSQL, I can no longer hear any noise when I open the squelch. When I turn off the tone encoder the squelch operates normally. Also, when I key-up a repeater on some(not all) of my memory stations (with the tone encoder activated), I can't hear the repeater come up & then shut down although I can see the receive light light up and the S-meter indicates proper reception of the signal.

If anybody has knowledge of what's causing this problem, I'd appreciate your input. I realize this situation may not be a "problem" at all but rather a normal situation with this rig; however, the manual doesn't mention this at all.

Have you got the ctcss rx call tone enabled? That would make the radio
ignore any call without the proper PL tone on it.

Source record: 199845

Anyone care to comment on the various CW keyboards marketed by MFJ?
I'm in line for a new keyer and it occurred to me that one that also
would provide keyboard capability might be a good idea. But there seem
to be at least three models, some with LCD readouts, and I'm wondering
(a) how well they work; and (b) how much of the bells and whistles is
worth having?
From reading the mail on 40, I gather many of the keyboard ops are
clinging ferociously to their old Heathkit models. Does this indicate
some shortcoming in the newer products?

Could someone point me to a source for Windows DTMF decoder software.
I have a Soundblaster16 & Windows 95. I'm doing some testing & this would
really help me out! Tnx! David.

>Socialist Union).

Men have the innate right to resist theft and coercion.
Socialism forces their compliance in contradiction to that
right by whatever physical means are necessary. It makes
no difference whether the enforcement occurs through the
courts or by occupation of the streets with thugs. All
who oppose the demands of government, regardless of the
immorality of those demands, are dealt with by force.
Anyone who can tell me why this isn't fascism, please
step up.

As to the new parties, they are related to the old by
their continued inability to divest themselves of the
aforementioned characteristic.

>> Acknowledging guilt is grossly inadequate to reconcile what
>> the Nazi party did in terms of the country's ongoing liability.
>> Germany is still governed by socialists and despite the horror
>> of their history, they have not formed a constitution capable of
>> preventing such atrocities in the future.

>Not (exactly) true. The current constitution, written with the
>guidance of the allies, prohibits any German military action
>outside germany. This provision was written in to prevent
>Germany from ever again engaging in offensive warfare and
>conquest. However, you do have somewhat of a point, Jack. The
>current constitution is weak in the most critical area -
>preventing hate crimes.

Ken, government should NOT be in the business of
prescribing punishment on the basis of one's beliefs or
opinions, even when they're obscenely offensive. This is
not the problem with the German constitution and I
consider it an exceedingly dangerous precedent in the U.S.

>Yes, Germany is governed by Socialists. Lets not forget one
>thing: Hitler was a facist.

Ultimately, all socialists are fascist and all fascists are
socialist. The distinction between the two is solely a
matter of perception. It has no effect on the violation of
rights that each system requires in order to survive, nor
the fundamental belief inherent to each that the state is
superior to the individual.

>> For the present government to merely understand and
>> admit that the genocide committed by the Nazis was wrong
>> will be of little comfort to any future victims.

>I agree! But what would you have them do? Mass suicide? They
>have been defeated, humiliated and occupied for 51 years now.
>The UN has forced a new constitution on them and they have
>abided by it. So, what more can they do?

I'm not singling out Germany in my denouncement of socialism
and government atrocities. However, the Nazi Party serves
as an example of some of the most horrendous crimes ever to
be committed by the socialist mindset. If any country in
modern times ever had a reason to research the fundamental
errors in government that have allowed such crimes to be
committed, and to forge a constitution that distinctly
defines and restricts the moral purposes to which government
power can be put, it is Germany.

73,
Jack WB3U

> --

The IC735 did not have the programming loss problem that earlier radios (IC-745, IC-751) did ... if your battery dies, all that you will loose is any frequencies you have programmed into memory - you will NOT loose the operating system itself ... so continue on, and "Don't Worry"!

Are you using a true Peak Envelope Power meter? If you are using a conventional (average power) meter, what you describe is exactly true. If you look at an SSB envelope with an average-reading meter, you will see approximately 1/3 of actual power, due to duty cycle of the human voice.

If you are indeed using a PEP meter, then you may have a problem.

Good luck, and Very 73!

For all interested hams:

Note: this is not meant to be a spam I just thought I pass this offer onto
any ham.

I recently acquired 45 ethernet cards with BNC connectors, 8 Network hubs,
and two manuals. The cards are either 8-bit or 16-bit. I'm willing to let
the cards go for $5 a piece, hubs $20, and manuals you must contact me for.
Shipping adds $2 for cards $4 for hubs.
The cards or hubs have not been tested but when they were taken out of
service they were in working order.

Take one or the whole lot! Please reply to the e-mail adress below so everyone else does
not have to see your reply.

Anyone heard of a mod on this or another newsgroup involving the removal of a "white cap/disc" over the electret condenser mic element in the stock microphone of the 706 to make it sound better (presumably less sharp & more basy)?????? Someone at HRO mentioned this to me & I'm interested if anyone has any insights! I'm always told my audio is either low or sharp or tinny , no matter how many adjustments I make to the mic gain, compression gain control on the side of the radio , etc. Tnx! David N4ZGT

It's a solid state device which provides what you require, a high degree
of isolation and an external impedance match network.

I've also heard that Mitel and Harris Semiconductors have similar
circuits.

Hope this helps.
Brett.

What do you have to hide using an ANON RE-mailer ?

Although I have never posted ANYTHNG for sale or WTB here - I should point out that this group ** IS** titled "EQUIPMENT". I have over 10,000 newsgroups listed on my server and SWAP is not one of them - I might think that OTHERS in this same boat, scanning along might see EQUIMPMENT and think that is WHERE stuff about EQUIMPENT (in any form) should go. Since there is NO SPECIFIC TITLE like "equipment MODS or equipment PROBLEMS, or equipment REVIEWS, or equipment INFORMATION, or a host of other identifiers - I would have to side with those that POST FS/WTB here. Besides, I don't think the very few "ads" we get are a problem - I don't even D/L most of 'em, I just skip them while selecting what articles (messages) I want to D/L to read. So where's the problem ?

Message-ID: <01BB5646.4E14B520@Franklin.infowest.com>
Source record: 199718

09 June 1996

Ladies & Gentlemen:

Please direct my Inquiry to right person.

I am in need of an update computer system to help me while I go to =
school,
learning about computers and business.

You see I am a 100% Disabled Veteran (Desert Storm era). Finally, after
several years of REHAB, I have the chance to go to school and learn. My
school counselor says if I were to have a PC at home, similar to what =
the
school has, I could work at my own speed and pace. I could be able to
retain more of what was taught in class. As well as learn how to use =
the
incorporate programs into business use.

I was hoping to get help from the VA or another govt. agency, but after =
the
Govt. shut down, there wasn't anything.

It is very difficult for me to ask others for help, everything I ever =
received I had to work for. But now my disabilities=20
prevent me from working, as I once could. =20

If there is someone in your company that can help me, I would appreciate =
it. I will even accept PARTS that can be used in a system, PERIPHERALS, =
SOFTWARE or anything related, I can use in my computer/business classes.

I can send you a letter from the Veteran Affairs, verifying my =
disabilities if needed.
=20
Sincerely
Stan Bown
726 N 120 E
Hurricane, UT 84747

****

PS: If you cannot donate anything, would you consider selling "your =
product" at COST? (Although I am on a set income, I am able to save a =
little).=20
....even my VHF/UHF, I use in the shack QUIT!
**********=
***

I would hope that someone will reply, even if you cannot help.

I bought one at Dayton and haven't received the cable yet either. I
guess I wasn't too surprised at this point given the number they sold
there, but you message does have me a bit concerned.

THANK YOU, KEVIN! I'm glad to see someone who understands our "side". As an RS store manager, I can tell you that everything Kevin says is true. I could take up an incredible amount of space telling about all the different scams that people try to pull on us to get a free product. There are an awful lot of folks out there who seem to think if they yell, scream, and bitch loud enough they'll get anything they want (which, unfortunately, at times is all too true). I've seen items that "customers" have incredibly abused and then they bring it in, wanting a new one for free. And that's only the beginning. One thing I get tired of real quick is those who think that they'll get somewhere by acting like maniacs and cursing out me, my employees, the store, the company, and anything else they can think of. I no longer even listen to those folks - I tell them if they want to do business with me, I'll be happy to take care of their problem once they calm down and act professionally. If they refuse, I throw them out. If they don't leave, I call the police and make them leave. My district manager doesn't have a problem with that. I bend over backwards, as most managers do, to help my customers but I don't - and won't - stand for some of the crap people pull and the way some of them act. A lot of people out there need to grow up and act their age instead of like spoiled little brats. And for those of you who don't like RadioShack, no problem - exercise your rights in our wonderful capitalistic society to take your business elsewhere! I, for one, won't miss you!

>ops are clinging ferociously to their old Heathkit models.
>Does this indicate some shortcoming in the newer products?

I'm not familiar with the newer models, but I have a Heath
keyboard that I bought new. I'll tell you briefly what I
like and don't like about it so you can make a comparison.

What I Like:

The Heath keyboard is lightweight and easy to carry. It runs
directly on 12 - 13.8 VDC. The rear panel has a Power switch,
Reset switch, headphone jack, volume control, pitch trimmer
(screwdriver adjust), and separate output jacks for positive and
negative keying. All other functions including speed, weight,
sidetone on/off etc. are controlled from the keyboard. The 'board
can be set to provide an audible "click" when each key is pressed.
There are ten numbered memories and automatic contest numbering.
It has several practice modes in which it generates random (actually,
programmed into ROM) characters. The 'board uses a three-color LED
bar-graph display for monitoring the amount of memory used in the
type-ahead buffer. Key action is nice and smooth, and the keyboard
has certainly lasted longer than any PC keyboard I've owned.

What I don't like:

Memory contents are retained by watch-type batteries that are not
particularly easy to change and seem to give up the ghost fairly
regularly. There is no input for external keyer paddles. Speed
and weight are set by entering the numbers into the keyboard; I
would have preferred a simple twist knob for these functions.
There is no way to monitor the actual characters in the type-ahead
buffer, therefore, a typo cannot be detected (or corrected) unless
you become aware of it as it's entered.

Hope this helps.

Try resetting the CPU. The swithes to do this are
under the battery pack. Be sure you follow the
instructions for Gen or Ham coverage.

>Richard Booth, G0TTL

Yes, this is a common problem with the FT102. It has loads of relays in it, and these can be a big source of problems. So much so, some radio service shops won't touch them.

That's the bad news. The good news is that it is not too difficult to clean up and/or replace the relays. Some of the relays have removable tops, so you can get some switch cleaner on them. The smaller relays are standard 24V relays which you can still get hold of quite easily. The biggest problem is getting some of the PCBs out. Hopefully, though, a good clean will solve most of the problems.

I have an FT102 whose previous owner was a heavy smoker, and it was filthy inside. It was exhibiting the exact same fault that yours is. I found the cause was dirty contacts in the relays on the RF unit (I think its called). This is the board on the top of the chassis, at the front, on the right hand side, just in front of the PA box.

The fault went away when I cleaned the accessable relays on that board.

I had a similar fault whereby the transmit power was down on some of the bands, and the PA didn't seem to load up correctly. This turned out to be dirty contacts on the band switch wafers. I suggest you give these a good clean while you are at it. (I got loads of brown gunge off these contacts in my radio.)

WARNING!!! If you are poking around inside the PA box, remember that the 800V HT supply remains for a _considerable_ time after the rig is switched off (can be of the order of hours). Be very careful not to touch anything inside the PA box. To be really safe, it may be a good idea to discharge the HT caps with a high value resistor and a well insulated probe .before starting work.

Good luck fixing your FT102. Despite the relay problems, it is a good radio (top of the range in its day I think).

73 de Ian, G0TCD.

> ?
>
> David W7AQK
>

I've been waiting for mine since the start of the free cable campaign
..back in JANUARY. I've been in contact with an Icom rep via e-mail.
He claimed that a cable was sent out to me about 2 months ago...it never
arrived. He promises me that another cable is on the way.

I bought my 706 with full intention of mounting it remotely and cannot
permanently do so until I receive the cable. (The 6m Es season is
passing us by in the meantime).
The Icom rep told me that the response has been overwhelming and the
supply of cables is backlogged. Funny however that you can go buy one
at the local candy store and they can replenish their stock when needed.
(Maybe Icom won't mind if we buy one and bill it to them :)

I'm getting fed up with waiting but I will give it another week or so
for the cable to arrive as I was told...then I will start barking again.
I think I've been pretty patient waiting over 6 months now. I'd be
dissapointed as hell to find out that someone who has purchased a 706
after I did has their free cable.

I believe that Icom should have bundled the cable along with the radios
in the lots to follow the start of the offer. They don't mind taking
our money up front !

3796. first rig

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-10 00:00:00 UTC
From: Daniel_F._Stiles@inetgate.UShmm.ORG
Message-ID: <9605108344.AA834422878@inetgate.ushmm.org>
Source record: 199736

Scott wrote about what a new ham should get for a rig.

Well Scott, you have asked a question that will probably get you as many diverse answers as the number responding to your question.

I sense from your wording, cost is a consideration.

I might suggest instead of looking at specific brands and models, you consider the following:

Decide what your budget is going to be. Remember to factor in all the extras such as antennas, keys and or keyers, computer interfaces for Packet or Rtty, RF cables, and SWR bridge if desired and all the rest of the little things.

After you have figured out what is left to spend then shop the ads in the Ham Publications or direct on the internet.

It might be that used equipment is all you can afford. There are still some wonderful used rigs available from reputable dealers that will stand behind their product.

The trade-off on the older gear is that is does not have all the bells and whistles. Decide just how important the extras are. For example do you need a rig that will store 100 frequencies on HF? Or one that will directly interface to a PC for full computer control?

I think you are making reference to the ICOM that covers HF and 2 meters. That might be a terrific radio but do you need it or more importantly can you afford it? There are many first class used radios in the $600 and up price range. A good used 2 meter or dual band HT or mobile can be had by carefull shopping for about $250 and up. Yes, occasionaly you will find both for less.

Anyway, keeps your eyes and ears open and you can find good gear without having to take a second mortgage.

If money is not a problem, go for the top of the line. But remember, it may not be the right rig for you.

Perhaps the most important comment of all--the best radio in the world will not well with a bad antenna.
and on the other hand, a well working and located antenna will make a lesser rig work with the best of them.

Hope it helps

73 and an early welcome
Dan, KB1BG

If I recall, the FT227R display blanks to indicate a loss of
lock in the synthesizer's phase locked loop. That's often
due to a defective crystal or other component in an offset oscillator.
You didn't mention if the problem occurs on simplex and both + and -600
kHz offsets.

Too, a failure in one of the power supply stages (e.g.,
a pass transistor or 3-terminal regulator) which services the
transmitter could cause this.

I bought an FT227R new in 1978 and designed and built a multimode
scanner controller inside. I no longer have the radio nor the
schematic.

3803. Field Day cw reader

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-10 00:00:00 UTC
From: n0nas@hamlink.mn.org
Message-ID: <834393958.AA06585@hamlink.mn.org>
Source record: 199743

Last year our Field Day station worked 20M CW using a PK-232 to decode CW and the WR9R logger program to send CW. We didn't have much time before the contest to experiment with the setup but did seem to have somewhat improved results with a DSP-9 ahead of the PK-232. This year we have the PK-232 and a DSP-59+ to work with but I'm interested in comments from the audience about anything they have used that might be better than the PK-232 for CW decode.

I borrowed an old stand alone Morse-A-Word decoder box and I also thought I'd try the HamComm v3.0 program, but I'd like to know what you've tried and found to work. Preliminary comparison says the Morse-A-Word decodes more reliably than the PK-232 but it only has an 8 character display. We can't rely on having good CW operators at the station the whole time and I'd rather not switch back to phone. Thanks for the replies. 73's.

Doug Reed, N0NAS email: n0nas@hamlink.mn.org
St Paul, MN

P.S. No, teaching 20wpm CW to all operators between now and Field Day is not an option but by having a chance to try it some might like it.

I guy that I work with is apparently having a problem with his Radio Shack HTX 202 HT. Sometimes when he keys up on it, he gets an error message <ER-2>. Is anyone familiar with this and what it might mean. It seams to do it after it has been off for a while and when it does, he has to reset the unit's CPU.

Any info would be greatly appreciated

>for this device.

The MicroMatic is one of the most forgiving devices out there: it has a bridge rectifier and 3-terminal regulator on the power input. Any voltage from about 8 to 20 or so, AC or DC, either polarity, will work fine. I use a Kenwood wall-brick battery charger. I don't recall the current required, but it's modest.

3812. TTL - RS232 Chips for CAT Interface boxes

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-10 00:00:00 UTC
From: tomms@mnsinc.com
Message-ID: <4phj93$nlq@news1.mnsinc.com>
Source record: 199752

If anyone is interested in a source for the Computer interface chip as described in the 1996 ARRL Handbook, Digi-key has them for $3.00 a piece. If you buy less than $25.00 of merchandise, you are charged an extra $5.00. Perhaps, a local club would be interested in buying more. Additionally, a packet cluster may yield enough interested parties.

The toll-free for Digi-key is 800-344-4539 and the part number for this item is Maxim MAX232 CPE (16 pin DIP).

Good Luck,

Tom, NY4I

->>Thanks a million.
->>Ham Burger

Well...being as guilty of "misuse" of this newsgroup as the rest, it
might be well to reflect a bit on the foundations of the group...

Is it any less commercial for me as an individual amateur to ask if
anybody has an old outdated part to fix my old outdated radio as it is
to ask for technical advice on what might be wrong with my radio?
That is, unless we are willing to only talk about homebrew gear, we
are talking about commercial "equipment" in this group. Even if we
restrict it to homebrew, how many of you have busted a pencil apart
recently to make a resistor or wrapped tinfoil around saran wrap to
make a capacitor? Not to mention melting beach sand and drawing your
own silicon crystals out of it. Homebrew designs still revolve around
commercial parts.

So what we have is, in essence, a newsgroup dedicated to the
discussion of commercial equipment. I fail to see the difference
between asking advice on how to use the Kencom or Yaewood and seeing
if I can find a used one for my private personal use.

Not to mention that the "laws" in a democracy evolve as a function of
common use. The speed limit in New York at one time was 3 miles an
hour, and if you were caught galloping your horse faster, you were
breaking the law (if they had a horse fast enough to catch you). I'm
not at all sure that the average speed in New York today is any
faster, but the speed LIMIT is now geared towards a mode of
transportation that has a higher reasonable speed. This is an
EVOLVEMENT of what the "reasonable man" expects to find as a
limitation of living in a democratic society.

So do the laws and mores of a group evolve as a function of how the
group wishes to conduct itself. If this is a closed and moderated
group, then the closers and moderators have all the right in the world
to censor and select what appears on the group. In an open group such
as this, it seems that the users pretty well define what the uses of
the group will be, and I've seen as much "for sale" as "please help"
posts in my short time reading. I'm not suggesting that the group put
up with "Mistress Sally Hot Photos" ads, but I'm pretty willing to

allow a private amateur posting a FS or WTB for their personal use.

Besides, like most reasonable people feel about censorship on the broadcast media -- you've got the on-off switch in your hand, use it.

Hello Everybody,
I apologize if this post does not belong on this particular
newsgroup. This seems more appropriate than any other related to
Amateur Radio.
I am interested in buying the new Icom IC-2710H dual-band mobile
XCVR. Does anybody have one? I am looking to get some information
before I spend the money for it.
How do you like it? What do you like about it? What DON'T you like
about it? Any problems? Would you recommend it to other Hams? I would
appreciate thia and any other info regarding the `2710H.
Thanks as hope to hear from you soon!
Best of 73,
Brian, N5ZGT

>more basy)??????

This wouldn't surprise me in the least. Someone at ICOM figures that all mobile microphones should have low output to force the operator to speak louder and, in the process, to increase the signal-to-noise ratio within the typically noisy mobile environment. They did this on the IC-2410's and it sounds like they are continuing the tradition here.

Typically, the mics can be opened up by removing a diode across the mic element, but you should obviously verify this for the mic you have. To their benefit, ICOM is usually pretty open about telling you how to do this.

Good luck!

Ty

Mechanical filters have an almost square "shape", but yield extremely
high harmonic artifacts; luckily these are easily filtered with
conventional techniques. Their insertion loss is significant,
requiring an extra stage of i.f. amplification.
(Paraphrasing Collins brochure from the '50s)

Hi Jim, Instead of willy-nilly violation of the guidelines, it would seem to me to be more logical to change the guidelines. If the guidelines are changed to allow for sale postings here, I will simply choose to drop this newsgroup from my reading list. As it stands at the present, the guidlines should protect me from unwanted for sale postings.

In most cases, all one needs to do is get into the menu while in ssb mode
and change Q4, the carrier freq down to about 0 or slightly below. This
gives better low freq response.

> Best of 73,
> Brian, N5ZGT

Brian, I traded for one at the Orlando hamfest a couple of months ago
and have it in my van ...

Good points ...
Excellent receive and transmit range. I use a dual band glass mount
antenna on the side of my minivan and range on simplex while on vacation
last week was exceptional.
Selectivity is pretty good, Sensitivity very good.
Controls well laid out for mobile operation.
Easy to read front panel frequency readouts, day or night.

Not so good points ....
Cannot kill the duplex function. If I am scanning UHF and VHF and I
start to transmit on UHF, if someone starts talking on VHF you either
have to listen to them while you talk or turn the volume down on the
other band. Then, of course, you forget to turn the volume back up
later on and miss something.
Some rejection problems ... I get pagers interfering while downtown.
Mic hanger is goofy, just a square hole in a piece of metal.

Overall, I'm very happy with the quality and value of the unit. I
traded a 7 year old dual band HT and a 6 year old VHF only mobil rig +
$100 for mine.

The duplex problem is the one that really bugs me. I may be overlooking
some feature I cannot find in the manual, so check this out with your
dealer. If they can defeat that, it'll be an excellent unit.

One other note ... I looked at ICOM's home page on the internet to try to get some help on the duplex problem ... no soap ... say contact your dealer. Pretty poor internet capability that way.

Models CTMN6134B & 6055A, qty 20 mixed up

Desktop Station Mics, Amplified, classic MoCom style
46TMN1004A-1, great for CB also, qty 4, $25 each *firm*

and NTPN5505A power supplies, big heavy, that
power above in temp. base station mode, 220V

or make a bulk offer

MOCOM 35 Mobile Car TRXs, Model MD33CFA1300B
bigger 30Watt P.O., 138-174Mhz, 2 channel, 12Vdc
asking $30 each, qty 4 available

One big mother of a TRX, 50Watt P.O., this one is 120Vac
Model CL43BBB1100B , bring a buddy to lift this, $50 or
offer combined with other stuff

HANDHELDS! HANDHELDS! HANDHELDS!(138-174Mhz)

HT440's Model H33LCV6144A, 4 channels, no battery packs
qty 11 avaliable

HT90's Model H33HMV1124A, 2 channels, no battery packs,
qty 7 available

a bunch of flex antennas to bulk buyer(s)
Chargers Model NTN4636A (qty 9), Model NTN4635A (qty 8)
Model NTN4638A (qty 8), all with euro plug and 220Vac
Battery load test jig Model TEK-48 (qty 1)
make an offer on these 220Vac useful tings...

Other stuff
Pager Transmitter T1606AM , its massive, make offer
---

all units are surplus,
no delivery, the stuff will be heavy

OTTAWA ONTARIO CANADA

all prices are suggested and CDN $, no shipping inc.
[some of it is just way too heavy]

Looking for a GE 8950 tube or equivalent.

What other tubes are substitutes?

3828. Computer Control Question (com Port)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-06-10 00:00:00 UTC

I have a Kenwood that I have been controlling through a serial (com) port on my PC laptop. Just recently I installed a TNC and a logging software package that works off my local DX cluster. If a DX spot comes through that I am interested I can click on the spot as it shows up on the logging program and then have the RC program move the receiver to the proper frequency and mode. This all sounds pretty neat but... My laptop only has 1 serial port 1 parallel port and a PCMCIA slot. Since I need 2 Com ports to pull off the neat operation described above, does anyone know of a PCMCIA card that will allow a second com port or for that matter any other work around.

Thanks,

Richard

1. Does any one know of a commercial HT that is designed for aircraft and Ham use???

2. Does anyone know of a Ham radio that can do both (rx and TX) on aircraft freq. (Please, I dont want any of the psudo lawyer busy bodys giving me grief about type acceptance, I know its not, but as an emergency back up I'll take my chances~!)

Thanks!

Hello All:

I just read an article on the C508A micro, mini dualband handheld (May CQ) and what to know if it is possible to open up the receiver in the blocked ranges?

73's

Try about $40.00.

I had a similar problem with the ICOM 725. With the volume all the way down I measured 60mV of noise at the speaker. The volume control was too sensitive, blasting with the control just turned up a little(this was also confirmed in a QST product review). ICOM also denied that there was any problem, say that the rig was "very sensitive".
I fixed it by changing one resistor and lowering the ouput audio amplifier gain. I have seen the same problem in other ICOM's. They seem to crank up the audio gain too much, possibly to give the impression that the radio is really sensitive.

Richard, W6GHD
